Business Transactions

Purpose

You use this component to post and process your business transactions. Within Contract Accounts Receivable and Payable, these processes are largely automatic. They are controlled by the settings you make in Customizing, which you assign at business partner/contract account level. However, you can also enter them in the line item if this particular line item is to be processed separately.

Debit Entries and Credit Memos

Purpose

This component enables you to transfer receivables and payables from an operational system and to post them in **Contract Accounts Receivable and Payable** .

Industry Component Utilities (IS-U)

Data is transferred using the **Invoicing** component of the industry component **Utilities.**

Industry Component Telecommunications (IS-T)

You can transfer posting data from the operational system (billing system) to **Contract Accounts Receivable and Payable** using a transfer report (**SAP Easy Access:Transfer Posting Data Execute Document Transfer) .**

Industry Component Public Sector Contract Accounts Receivable and Payable (PSCD)

You can use the document transfer program to transfer posting data from operational systems.(See SAP menu: **Periodic Processing Transfer Data Documents Transfer**)

Collective Bills

Purpose

A collective bill groups documents from different contract accounts in a collective bill document in order to process them together.

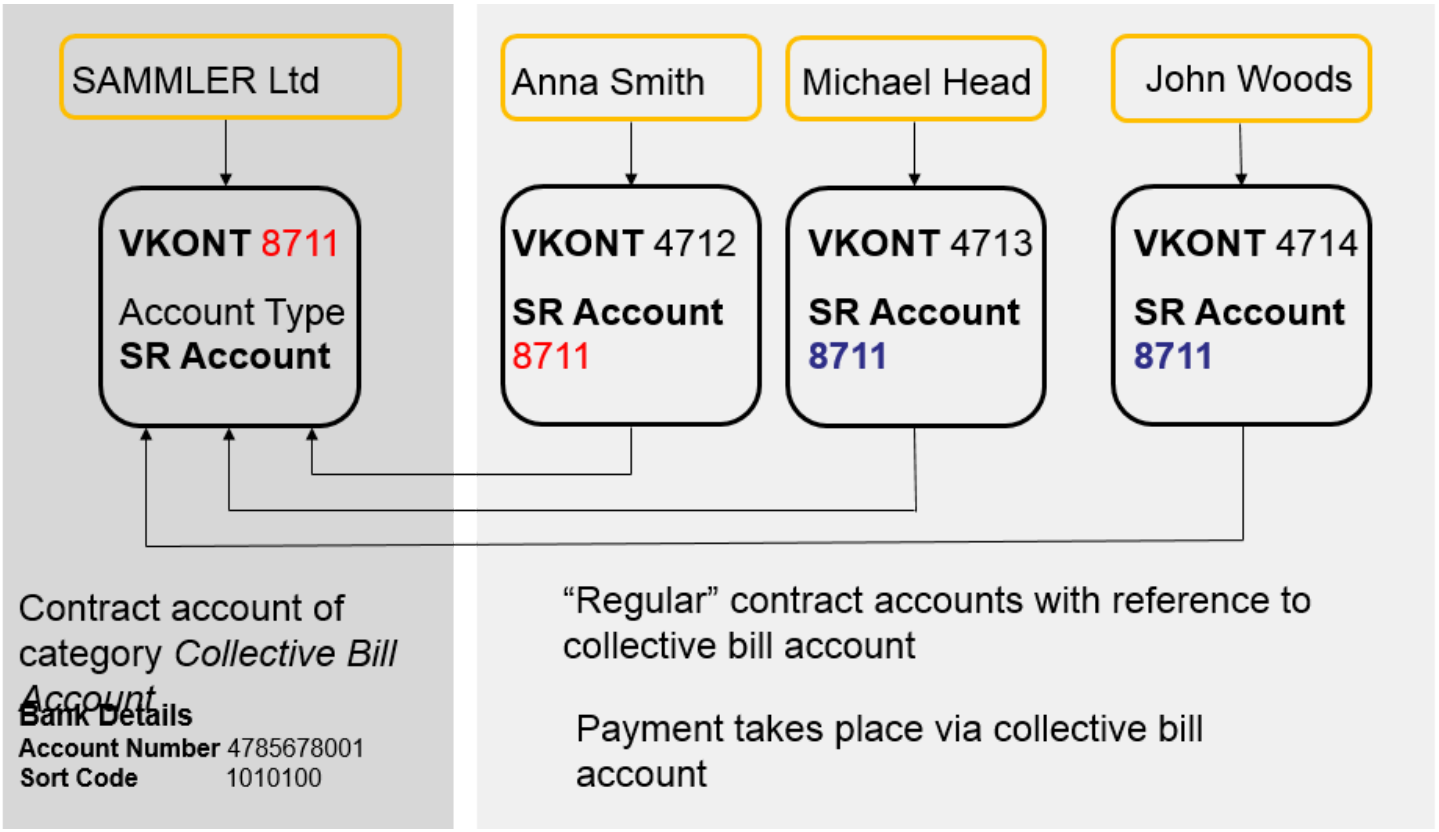

Features

You can manage and process all of the individual documents in a collective bill document together via a third account – the collective bill account. You can create a joint invoice and make the payment or in the case of payment arrears, dun all of the items in the collective bill together.

Example

Collective bills are particularly useful for billing property management, residential construction companies, and companies with branch-head office relationships.

A residential construction company handles the payment transactions with the relevant utilities companies for its tenants (payments, dunning notices, returns, correspondence). The utility companies manage each tenant of the residential construction company and the related receivables in its SAP System but summarize these receivables in a collective bill and process the collective bill via the residential construction company. The residential construction company pays the receivables that arise with the utility company for its tenants and then bills these to the tenants.

Relationship of the collective bill account to the individual accounts

Posting Collective Bills

Purpose

Joint processing and management of items for individual contract accounts in one collective bill account.

Prerequisites

To use the functions described below, in the Implementation Guide for **Contract Accounts Receivable and Payable** , under **Program Enhancements** > **Define Customer-Specific Function Modules** , enter FKK_COLL_BILL_CREATE_0063 for event 0063, provided this module is not already integrated in the industry-specific module for event 0063. In the industry components **Utilities** and **Telecommunications** , this module is already integrated in the industry-specific module for event 0063.

Make the following entries in the Implementation Guide for **Contract Accounts Receivable and Payable** :

- **Basic Functions** > **Contract Accounts** > **Number Ranges and Contract Account Categories** > **Configure Contract Account Categories and Assign Number Ranges** Create a contract account category for collective bill accounts. Set the indicator in the column **CB** (**Contract Account Is Collective Bill Account**) and assign a number range to the contract account category.
- **Basic Functions** > **Postings and Documents** > **Document** > **Maintain Document Account Assignments** > **Document Types** > **Maintain Document Types and Assign Number Ranges** Create a document type for collective bill documents and assign a number range to this document type.

- Basic Functions > Postings and Documents > Document > Maintain Document Account Assignments > Maintain Defaults for Document Type for Collective Bills > Define the document type that you defined in the previous step as the default for creating collective bill documents.

The main and subtransaction for the collective bill item are determined in event 2222. You can overwrite industry definitions implemented for this event. This event has already been defined for the industry component **Utilities** .

Procedure

At master data level, you have to assign the individual contract accounts to a collective bill account. A collective bill account is a contract account of the contract account category **collective bill account** . You have to define this account in the master record of every contract account whose postings you want to group in a collective bill. There is no change to the assignment of contract accounts – that you link via the collective bill account – to your business partners. To link an account with the collective bill account:

1. In the SAP menu, choose **Contract Account** > **Create** > or **Change** .
2. In the field **Collective Bill Account** in the area **Invoice Creation** on the tab page **General Data** , enter the required collective bill account.

Once you have assigned the account to a collective bill account, when you enter posting documents in this account, each business partner item is automatically linked to a statistical posting document (collective bill document) in the collective bill account. The posting item for the collective bill document has the statistical key S (collective bill item). In the items of the individual documents, the field **Number of Representative Document of Contract Accounts Receivable and Payable** (DFKKOP-ABWBL) is filled with the document number of the collective bill document and the field **Category of the Representative Document of Contract Accounts Receivable and Payable** (DFKKOP-ABWTP) is filled with the value S .

You can summarize several posting items for one or more individual accounts of a collective bill account in one collective bill. The individual posting items are summarized in one collective bill according to the following criteria as standard:

- Origin
- Posting date
- Due Date
- Due date for cash discount
- Cash discount percentage rate
- Currency
- +/- sign of amount (credit/receivable)

In event 2225, you receive a selection of the collective bill documents that qualify for the inclusion of the individual document according to the criteria described. Here you can decide on a specific collective bill document or trigger the creation of a new collective bill document.

In event 2220, you can also group the line items according to additional criteria, such as company code and transaction, or prevent the creation of a collective bill for specific items.

The collective bill reference is created automatically in event 0063.

When there is a posting to an individual account, for each new business partner item entered, the system automatically creates a statistical posting document (collective bill document) in the collective bill account assigned or links the document with an existing collective bill document. This means that several individual documents link to one collective bill document. However, further individual documents are only included in an existing collective bill document if the collective bill document has not been

(partially) cleared or reversed. The amount of the collective bill document is the total of the amounts of the individual documents that belong to it. The general ledger-relevant posting, if required, always takes place at individual account level.

In some special cases, no collective bill document is created when you enter individual documents. For example, document line items with a clearing restriction or documents explicitly excluded from the collective bill in event 2220. When you post line items that do not link directly to a collective bill document number whose contract account is however linked to a collective bill account, the system fills the field **Alternative Contract Account for Collective Bills** (DFKKOP-ABWKT) automatically.

Clearing Collective Bills

Use

Clearing collective bill items

Features

You can initiate clearing at individual document level and collective bill document level. When you post the clearing, clearing at one level (individual document or collective bill item) is automatically updated in the other level in the same clearing document.

When you clear a collective bill document, the system clears the related individual documents as follows:

- If you completely clear a collective bill document, the system clears the related individual line items completely.
- If you partially clear a collective bill document, the system splits the clearing amount over the related document line items in accordance with the specifications in clearing control.

The clearing involves two steps:

1. Assignment of the clearing amount to the statistical collective bill item

   The assignment can take place, for example, manually or automatically in accordance with the rules defined for the respective clearing process (for example, for payment lots, cash desk, automatic account maintenance) in clearing control. A separate clearing type is reserved for each process in clearing control.

2. Split of the clearing amount of the statistical collective bill item determined in the first step over the related individual documents

   The automatic split takes place independently of the underlying clearing process based on the clearing control rules defined for clearing type `20s` . The clearing type `20s` by SAP as standard.

A clearing variant defined for clearing type `20s` must ensure that the clearing amount due for the collective bill is distributed completely to the related document line items. The clearing variant must not use rules for automatic write-off of tolerance variances. If the individual documents cannot be split, the clearing process issues an error message. In this case, check the Customizing for the clearing variant concerned.

In the individual business processes, clearing takes place as follows:

Business Process	Posting of Clearing for a Collective Bill
Automatic clearingAccount maintenance	In automatic clearing (SAP menu: **Periodic Processing** > **For Contract Accounts** > **Automatic Clearing**), you access clearing processing at the level of the statistical collective bill documents.

Business Process	Posting of Clearing for a Collective Bill
	Therefore, do not enter individual accounts as selection criteria unless you only want to clear items that are not assigned to a collective bill within an individual account. The automatic clearing proposal for the collective bill is made using the clearing control for clearing type `04` . Clearing locks or deferrals are only considered if they are set in the collective bill items; clearing locks or deferrals in an individual document of a collective bill are not considered. In manual account maintenance (SAP menu: Account > Maintenance), you can initiate clearing at the level of an individual account or a collective bill account.
Payment Run	In the payment run, you access payment at the level of the collective bill documents. The payment run uses payment information, such as the payment key and bank details from the collective bill account and the business partner data assigned to this account. If you enter individual accounts as selection criteria, the payment run does not select any items and there is no processing unless an individual account contains payable items that are not assigned to a collective bill. The payment run only considers payment locks or deferrals at the level of the collective bill document. Payment locks or deferrals in individual documents of a collective bill are not considered by the payment run.
Payment LotCash Desk	The payment assignment at individual document level is an exception, since the collective contract partner is responsible for payment, and not the individual contract partners. However, in the payment lot and the cash desk, you can assign payments at the collective bill document level and the individual document level. When you post the payment document, the clearing is automatically forwarded to the other level.

Example

For the collective bill document 8711 in the amount of 398, consisting of individual documents 4712 in the amount of 116, and 4713 in the amount of 232, there is a payment for 150. Using the clearing control, the system determines that the clearing amount leads to complete clearing for document 4712 and partial clearing of document 4713. Once you have posted the payment document 0815, the following items arise for the documents specified:

Document 8711

Item 1, subitem 0: Amount of 198 still open

Item 1, subitem 1: Cleared with payment document 0815

Document 4712

Item 1, subitem 0: Completely cleared with payment document 0815

Document 4713

Item 1, subitem 0: Amount of 198 still open

Item 1, subitem 1: Cleared with payment document 0815

Processing Collective Bills

Use

In the SAP menu, under Account > Process Collective Bill :

- Include open items for a contract account that belongs to a collective bill in an existing collective bill or create a new collective bill for these items
- Remove open items from an existing collective bill and create a new collective bill for them
- Remove open items from a collective bill and leave them in the respective contract accounts

Removing open items from collective bills makes sense particularly if a customer has complained about a collective bill item. By removing the item concerned, you can check the content without delaying the processing of the remaining collective bill items. You can therefore, for example, set locks for the removed items and change the deferral date. This means that you can control processing in the subsequent processes independently of the collective bill.

SAP recommends adding items if a contract account is integrated in a collective bill account and you want to integrate the open items in this contract account into the processing steps for the collective bill.

Activities

In the area **Collective Bill Account** on the initial screen, enter a collective bill or a collective bill account, or, in the area **Contract Account Level** , enter a business partner and/or a contract account. You can then use the following functions:

Include Items

1. If you select this function, all open items of the business partner/contract account are displayed on the subsequent screen. If you have set the indicator **New Collective Bill** on the initial screen, the system creates a new collective bill when you enter an item. Otherwise, the system includes the selected item in an existing collective bill.
2. Select the required items and save your entries.

If a new collective bill is created, the system adds the collective bill number to the document. If the item is included in an existing collective bill, the amount of the item is added to the total amount of the collective bill.

Remove Items / **Split Items**

1. If you select this function, the collective bills for the business partner/contract account are displayed in the tree structure on the left side of the following screen. If you have specified the collective bill account as selection criterion, all of the contract accounts belonging to this account, and, in turn, all the open items belong to these contract accounts are displayed in the tree structure. The open items of the collective bill account selected are displayed in the upper right area of the screen. The lower part of the screen contains the list of the items to be processed. If you select a collective bill in the tree structure (double-click), the items belonging to this collective bill are displayed on the top half of the screen.
2. To remove items from the collective bill, select them and choose . You can remove any number of items from the collective bill in this way.

3. Select the items removed and save your entries.

4. If you split a collective bill, the system updates the total amount of the existing collective bill and subtracts the amount of the items removed. The number of the existing collective bill is replaced by the number of the new collective bill in the document removed. When you remove one or more items from a collective bill, the number of the collective bill is removed from the document and the total amount of the collective bill is reduced accordingly.

When you delete a collective bill account in the master data of the contract account, you can remove the open items from the collective bill. These items are then only assigned to the individual contract account.

If you want to lock individual items of a collective bill, you can include these items in a new, separate collective bill and lock this bill.

For installations where collective bills are not used, you can deactivate the functions of the transaction **Process Collective Bill** . To do this, in Customizing for event 6100, define a corresponding installation-specific function module (see **Program Enhancements** > **Define Customer-Specific Function Modules**).

ℹ Note

When you change a collective bill, you cannot change the master data, such as the collective bill account, simultaneously.

Locks are not inherited when you remove or include open items.

Business Transactions for Collective Bills

Use

Processing collective bills for:

- (Partial) reset of a clearing
- Dunning overdue receivables
- Posting security deposits
- Posting interest arrears
- Writing off receivables
- Adjusting receivables
- Granting installment plans
- Writing off collective bills

Features

Business Transaction	Procedure
Resetting clearing	With the transaction **Reset Clearing** in the SAP menu under **Document** , you can reset clearing at the collective bill document level as well as at individual document level. The system automatically updates the clearing reset at the other level. If you partially reset clearing, the system offers the items of the individual accounts for selection in the clearing document. If you select the option **Retain Distribution to Accounts** on the initial screen in the area **Setting for Posting Clearing Amount** , you can define whether

Business Transaction	Procedure
	the posting on account is posted to the individual account or to the collective bill account. Partially resetting clearing is particularly useful if you discover an error in an individual invoice after the payment of a collective bill. In order not to have to reverse the complete payment and assign it again, you can, for example, carry out a partial reset of clearing only for the individual account concerned, and post a payment on account to this individual account. You can then take this into account when you clear the corrected individual invoice.
Dunning	Dunning notices are created at the level of the collective bill documents (see SAP menu: **Periodic Processing** > **For Contract Accounts** > **Dunning** > **Dunning Proposal Run**). If you enter individual accounts as selection criteria in a dunning run, the dunning run does not select items and therefore does not create any dunning notices. The system posts dunning charges to the collective bill account – not to the individual accounts. The system also only updates the dunning history for the collective bill account. In dunning printing, a breakdown of the collective bill document into the individual documents is not supported as standard. If you require this information, you have to provide this in the dunning form itself.The following restrictions also apply to dunning collective bills: • The dunning run only uses information from the collective bill account. • A dunning lock or deferral is only considered if it is in the collective bill document. Deferrals or dunning locks in line items in a collective bill are not considered.
Security Deposits	You have to create security deposits and down payment requests at individual account level. The system also posts a statistical collective bill document for the collective bill account.
Interest Calculation	In the item interest calculation, you can only select individual documents. This applies for automatic interest calculation (transaction FPINTM1) and manual interest postings (FPI1). In the interest calculation, the system also posts a statistical collective bill document to the collective bill account.
Write-Off	The automatic write-off (transaction FP04M) takes place at individual account level. When you enter collective bill documents as selection criteria for a write-off, the system does not select any items and there is no write-off. For manual write-offs (transaction FP04) you can select collective bill documents and individual documents. However, the system displays the collective bill documents for information purposes only. They cannot be modified/written off. You have to write off the collective bill documents using the relevant individual accounts as selection criterion.
Adjustment of receivables	In the transaction for adjusting receivables (FPZW), you can enter both individual accounts and collective bill accounts. The posting is always for the individual documents.

Business Transaction	Procedure
	The adjustment of receivables by age (transaction FPRW) takes place at the individual account level.
Installment Plan	You can only create installment plans at the collective bill account level.
Changes to master data	To cancel the assignment of a contract account to a collective bill account, in the field **Collective Bill Account** in the contract account, remove the collective bill account. This means that all future postings documents for the contract account are no longer assigned to the collective bill account. You can cancel the assignment to a collective bill account for documents that have already been posted using the transaction Process Collective Bills (FPCB). Alternatively, you can proceed as follows: 1. Reverse the documents. 2. In the master data, change the assignment to the collective bill account. 3. Post the documents again.

Displaying Collective Bill Items

Use

Displaying line items for a collective bill

Features

Line items of an individual account that are integrated in a collective bill are represented in the account balance display of the collective bill account by the related statistical collective bill item.

Activities

Line items of an individual account that are not entered in a collective bill, that have no direct link to a collective bill document number, and whose contract account refers to a collective bill account, are, as standard, not displayed in the account balance of the related collective bill account.

However, you can select these line items for the display in event 1211. To do this, in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Program Enhancements** > **Define Customer-Specific Function Modules** , define a corresponding installation-specific or industry-specific function module for event 1211. The selection can reference corresponding documents to the collective bill account via the field DFKKOP-ABWKT. This solution has already been realized for the industry components **Telecommunications** and **Utilities** .To display the line items for a collective bill document, proceed as follows:

1. From the SAP menu, choose **Account** > **Account Balance.**
2. As selection criterion, enter the required collective bill account and choose **Continue** .
3. In the display, place the cursor on the line item required and, in the menu, choose **Environment** > **Document** > **Line Items for Collective Bill** .

4. In the menu in the document display of the collective bill document, choose Environment > Original Item > To Collective Bill.

Security Deposits

Purpose

You use this component to manage cash and non-cash security deposits, such as savings accounts and payment guarantees, in your system.

Notes on Implementation

This component is optional. You need to implement it if you require your business partners to make security deposits.

Integration

If you are using the Item Interest Calculation component, you can calculate interest on cash security deposits.

Features

You can assign security deposits to contract accounts or to contracts. Once the “Valid for” date defined in Customizing has been reached, you can then repay or clear cash security deposits. You can return or cash in non-cash security deposits. Once the “Valid for” date has elapsed, they are automatically returned by a workflow.

Industry Component Utilities (IS-U)

You can create security deposits when you process a business partner move-in. Cash security deposits are offset against receivables at the time of final settlement when a business partner move-out is processed. For more information, see the Move-In/Out component of theUtilities Industry component . For IS-U, information on security deposits is provided in the front office.

Industry Component Telecommunications (IS-T)

With this component, you can only assign security deposits at contract account level.

For each security deposit, you can specify the type of service, the reference object ID, and an additional reference object. These fields are optional and you can use them for cash and non-cash security deposits. If you want to make the specification of this data obligatory, you can request the content of these fields in event 0820. You can change or delete the content of the fields later. For cash security deposits, these details are saved in the relevant request document.

Industry Component Insurance (FS-CD)

The system does not support the Security Deposits component.

Security Deposit Status

Definition

Specifies the current status of a security deposit.

Use

- Cash security deposits

  The status is derived from the history of the request document and is displayed but not saved when you maintain the security deposit.

  Non-cash security depositsThe security deposit category is stored in the security deposit for your information. In addition to the existing statuses **Created** or **Reversed** , you can also define further statuses (see the Implementation Guide for **Contract Accounts Receivable and Payable** > **Business Transactions** > **Securities).**

Integration

If the status of a non-cash security deposit is changed, a BOR event is initiated which can trigger a workflow.

Reasons for Request

Definition

Explains why a security deposit is required.

Use

Tthe reason for request is saved in the security deposit for information purposes, and, where cash security deposits are concerned, also in the request document.

Structure

Define the request reasons in Customizing (see Implementation Guide for **Contract Accounts Receivable and Payable, Business Transactions** > **Security Deposits**).

Integration

In the **Utilities Industry** component, you can enter the reason for the request when processing the move-infor the automatic creation of a cash security deposit.

Security Deposit Categories

Definition

States in which form the non-cash security deposit was provided.

Use

The security deposit category is stored in the security deposit for your information.

Structure

Define the permitted categories in Customizing (see Implementation Guide for Contract Accounts Receivable and Payable, Business Transactions > Security Deposits).

Cash Security Deposit Request Document

Definition

Statistical document in contract accounts receivable and payable for requesting a cash security deposit.

Use

The document number is stored in the security deposit for your information.

Structure

A request document is a statistical document with a document header and a line item

Processing Security Deposits

Prerequisites

In Customizing for Contract Accounts Receivable and Payable under Business Transactions > Security Deposits , you have:

- Defined request reasons for cash security deposits
- Created a number range with internal number assignment and the document type for request documents for cash security deposits and assigned them to the application component in the Customizing parameters
- Defined categories and statuses for non-cash security deposits

If you are using the industry components **Utilities** or **Telecommunications**, you have made settings for cash security deposits in Customizing for Contract Accounts Receivable and Payable under:

- Entered transactions under Basic Functions > Postings and Documents > Document > Maintain Document Assignments > Maintain Transactions for IS-U
- Basic Functions > Postings and Documents > Document > Define Account Assignments for Automatic Postings > Automatic G/L Account Determination . You have defined account assignment data relevant for transactions and main transactions.

Process

Cash Security Deposits

1. Either you create cash security deposits manually or the Utilities industry component creates them automatically when a move-in is entered in the system. The security deposit receives the status Requested.

   Using the function module `FKK_EVENT_0820_PAYMFORM_DET`, you can create a payment form number automatically when you create a cash security deposit request.

2. As long as the request document has not yet been cleared, you can reverse the security deposit. A deposit that has been reversed cannot be used again.

3. If you receive a (partial) cash security deposit payment and this clears the request document either completely or partially, the status changes to **(Partially) Paid**.
4. When the return date is reached, or when the deposit is released early manually, the system changes the status to **Released**.
5. If the cash security deposit payment is cleared by repayment or settlement against open receivables, it receives the status **Returned**.

You can release security deposits from the SAP Easy Access screen under **Periodic Processing** > **For Contract Accounts** > **Security Deposits** > **Release** .

Non-Cash Security Deposits

You create non-cash security deposits manually. When you save the security deposit, the system sets the status **Requested**.

Further processing is triggered by changing the status that you have defined for non-cash security deposits in Customizing. For each change of status, a BOR event is triggered. This BOR event can start a workflow, whereby you have to model your own workflows.

You can display an overview of all cash and non-cash security deposits. To do this, choose one of the following paths:

- **Role**: **Cash Security Deposits/Security Deposits (SAP_FI_CA_CASH_DEPOSIT)** > **Security Deposit Statistics Report**
- **SAP Easy Access screen**: **Periodic Processing** > **For Contract Accounts** > **Security Deposits** > **Statistics**

At event 0860, you can define follow-on actions for security deposits that meet certain criteria.

Example

An employee retrieves a non-cash security deposit from storage within the next week when the return date is reached.

Calculating Interest on Cash Security Deposits

Prerequisites

In Customizing, you have defined the specifications and default values for calculating interest on cash security deposits in addition to the general definitions for calculating interest (see Implementation Guide for **Contract Accounts Receivable and Payable** > **Business Transactions** > **Security Deposits**). The way in which the interest key for a cash security payment is determined differs to the standard way of calculating interest on items:

- If an interest key is specified in a payment, this applies.
- If no interest key is specified in a payment, the system tries to determine a key from the relevant security deposit. If no interest key can be found, no interest calculation takes place.

An interest lock at the level of contract account-dependent data is not considered during the calculation of interest on cash security deposits.

Features

This function has the same features as the posting debit and credit interest function (see Manually Posting Debit and Credit Interest).

Activities

To calculate interest on individual cash security deposit payments, choose one of the following paths:

- **Role**

  Interest Calculation on Cash Security Deposits(SAP_FI_CA_CSH_DEP_INTEREST_CAL) > Calculate and Post Interest on Cash Security Deposits .

- **SAP Menu**

  Account > Security Deposit > Interest Calculation

The procedure is similar to posting debit and credit interest.

Alternatively you can also make an interest calculation on cash security deposits in a mass run.

1. To do this, choose one of the following paths:
   - **Role** Calculation of Interest on Cash Security Deposits(SAP_FI_CA_CSH_DEP_INTEREST_CAL) > Cash Security Deposit Interest Run .
   - **SAP Menu** Periodic Processing > Security Deposits > Calculation of Interest on Cash Security Deposits
2. Enter a date and an ID that you can use to identify the run later.
3. Restrict the cash security deposits on which interest is to be calculated using general criteria on the tab page General Selections , or select them according to required posting parameters.
4. On the tab page Interest Parameters , enter the period for the interest calculation. If you set the indicator Create Correspondence , you can create interest notifications.
5. Schedule the program run. You can also carry out a simulation run. For more information about scheduling program runs, see Functions for Scheduling Program Runs .

You can display cash security deposit interest that has been posted in the security deposit maintenance.In the menu under Environment > Interest Calculation List , you can display an overview for the interest run.

Creating Security Deposits

Use

You can create cash and non-cash security deposits manually.

Activities

1. Choose one of the following paths:
   - **Role**: Cash Security Deposits/Security Deposits (SAP_FI_CA_CASH_DEPOSIT) > Create Security Deposit
   - **SAP Easy Access screen**: Account > Security Deposit > Enter
2. Enter a contract account and if necessary, a contract, and select the field for cash or non-cash security deposits. Enter the reason for the request and the amount, as well as the currency and the start date. For a non-cash security deposit you must also enter a type and a guarantor.
3. Save your entries.

Result

The system displays the number of the new security deposit. For cash security deposits, the request document is posted at the same time.

Note for the industry component Contract Accounts Receivable and Payable (FI-CA)

Using the account category in the contract account, you can determine additional data when you are posting cash security deposits. Define the account categories in Customizing for Contract Accounts Receivable and Payable under Basic Functions > Contract Accounts > Define Account Categories and then enter them under Business Transactions > Security Deposits > Define Special Specifications for Security Deposits.

Processing Security Deposits

1. Choose one of the following paths:

- **Roles**

Cash Security Deposits/Security Deposits > (SAP_FI_CA_CASH_DEPOSIT) > Display Security Deposit or Change Security Deposit

- **SAP Menu**

Account > Security Deposit > Display/Change

1. Enter the number of the security deposit required and select Continue .

The following table lists the functions available when changing or displaying a security deposit.

Functions with Display and Change	Menu Path	Explanation
Print correspondence	Environment > Form Printing	An application form is supplied as a sample
Functions only with Change		
Reverse	Edit > Reverse	You cannot use a deposit that has been reversed again.
Release cash deposit	Edit > Release	The clearing restriction of the cash security deposit payment is removed. This means that the payment can now be cleared.
Release cash security deposit in part	Edit > Release Partially	You can offset the released portion or pay it out if a payment method is defined in the partial release. Prerequisite for partial release: The status must be either Paid or Released Partially
Change amount of cash security deposit request	Edit > Clear Remaining Receivable or Edit > New Receivable	You can reduce the amount of the cash security deposit receivable later using the function Clear Remaining Receivable , or increase it using the function New Receivable .

		In the first case, a part of the original receivable is written off, in the second case a new cash security deposit receivable is posted with reference to an existing cash security, provided that this has not been reversed or released. The function **Clear Remaining Receivable** refers to all cash security requests in the contract that are still open. When you make a release, all security deposits are released.
Post new receivable	**Edit** > **New Receivable**	Instead of creating a new security deposit, you can post a new receivable. You can define the same amount of information (such as request reason) as is the case when creating a new security deposit.

Status of Cash Security Deposits for Changes to Payment Methods

Use

You want to react to the change of payment method in the contract account of a business partner.

Features

Using the function module FKK_EVENT_1025_DEPOSIT_CHANGE, you can automatically request or release cash security deposits if the payment method in the contract account changes. For a release, the new status is dependent on the initial status of the cash security deposit and changes as follows:

Old Status	New Status	Action
Requested	Reversed	The cash security deposit request is reversed.
Paid	Released	The cash security deposit is released for payment.
Partially paid	Released	The paid part is released; the residual part is reversed.

A new cash security deposit is created and existing deposits are released immediately when you save the change to the contract account. As standard, the function module FKK_EVENT_1025_DEPOSIT_CHANGE creates a cash security deposit in the amount of 100 units of the national currency using the first cash security deposit reason found in the list.

Activities

If you want to automatically release and create cash security deposits when the payment method in the contract account changes, define an installation-specific function module for event 1025 in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Program Enhancements** > **Define Customer-Specific Function Modules**. To do this, copy the function module

FKK_EVENT_1025_DEPOSIT_CHANGE and adjust the copy to meet your requirements, for example, the amount of the cash security deposit requested, the currency, the request reason, and the reversal reason.

Example

If a direct payer changes his payment method to bank collection, all of the cash security deposits in the contract account of the business partner are released automatically, since there is no longer any reason to retain the security deposit.

However, if a business partner who has previously paid his receivables by bank collection becomes a direct payer, you can automatically request a cash security deposit.

Security Deposits: Special Features for IS-U

This documentation section contains information about enhancements and variations from the FI-CA security deposits, which apply specifically to SAP Utilities (IS-U).

Create Security Deposits Automatically When Moving In

Use

A cash security deposit or a non-cash security deposit can be requested when the customer moves in.

Prerequisites

In Customizing, the field **Automatically Create Cash Security** must be filled out correspondingly in the **Control Parameters at Contract Level** in Customizing for the move-in (Choose **Customer Service** > **Process Execution** > **Move-In / Out** > **Move-In** > **Define Move-In Control Parameters at Contract Level**).

Procedure

1. Call up the transaction for entering a customer move-in: **Customer Service** > **Process Execution** > **Move-In** > **Create**

   The screen **Create Move-In Document:Initial Access** is called up.

2. In the subscreen **Contract**, enter the reason for the request and the amount of the request.

Result

When you save the move-in document, a cash security deposit, together with the request document, is posted and issued in the log.

Note

If you call up a security deposit requested during a move-in or move-in/out in the service territory is called up in the transaction **Display Security Deposit** (FPSEC3), the number of the move-in document that triggered the request is displayed in the screen area **Triggering Object** in the field **Move-In Document**.

Automatically Transfer Security Deposits When Relocating

Use

During the Move-In/Out of a business partner in a service territory for preexisting contracts (transfer contract), you can automatically transfer existing requests for cash security deposit and payments of cash security deposits to the newly created contract in the move-in. This for example makes sense if the utility contracts have ended when moving in/out and the security deposits previously made are however transferred.

If you reverse the move-in, the cash security deposits transferred are reversed as well.

ℹ Note

For further information see the documentation for SAP Utilities under **Customer Service** > **Process Execution** > **Move-In / Out** > **Move-In** > **Security Deposits** in the section **Transfer Existing Security Deposits**.

Prerequisites

In Customizing of **Contract Accounts Receivable and Payable** under **Business Transactions** > **Security Deposits** > **Maintain Specifications for the Transfer of Security Deposits** You have defined a document type and a clearing reason for the transfer of security deposits in the move-in/out processing

You have defined a document type and clearing reason for the move-in reversal and the reversal of the security deposit in Customizing for **Contract Accounts Receivable and Payable** under **Business Transactions** > **Security Deposits** > **Maintain Reversal Transfer of Security Deposits**.

You have chosen the option **X Request Cash Security Deposits** in the column **Automatically Request Security** and set the indicator **Automatically Transfer Security** in Customizing for **Utilities Industry** under **Customer Service** > **Process Execution** > **Move-In / Out** > **Move-In** > **Move-In Control Parameters at Contract Level**

ℹ Note

For more information about the settings for the transfer of security deposits see the Customizing activities documentation and the fields in the F1 Help.

Clear Cash Securities Automatically (IS-U)

Use

You can trigger cash security deposits in the context of invoicing. To serve this purpose, the cash security deposits are transferred to a credit memo. This can be returned or cleared.

Requests for cash security deposits that are not paid can be reversed when triggering a cash security deposit.

Prerequisites

In Customizing for Utilities Industry under **Invoicing** > **Invoice Processing** > **Item Selection in Invoicing** > **Item Selection for Account Maintenance/Define Subitems** you have entered the relevant details in the **R42 Main Activity for Cash Security Deposit** and the **Subtransaction for Payment** for the desired clearing type and clearing category from the contract account

ℹ Note

For more information about the clearing of security deposits see the Customizing activities documentation and the fields in the F1 Help.

Dunning Activities Request Cash Security Deposit

Use

Using the function module `ISU_NEW_SEC_REQ_AFT_DISC_0350` (**Dunning Activity: Request Cash Security Deposit**) a dunning activity that generates a cash security deposit is available if two device disconnections have taken place in the previous two years.

Integration

You can find more information on dunning activities in the SAP Utilities documentation under **Contract Accounts Receivable and Payable** > **Business Transactions** > **Dunning**.

For more information for the disconnection and reconnection of utility installations, see also the documentation for SAP Utilities under **Contract Accounts Receivable and Payable** > **Business Transactions** > **Disconnection/Reconnection of Utility Installation**.

Payments

Purpose

You use this component to create and process outgoing and incoming payments.

Features

The following detail components have been implemented:

Processing Incoming and Outgoing Payments

Creating Incoming and Outgoing Payments

Check Management

Receipt Management

Processing Credits

Processing Incoming and Outgoing Payments

Purpose

This component enables you to process incoming payments with payment lots. Payment lots group together payments from account statements that are to be processed together.

Key Features

You can enter payment lots as follows:

- You can manually enter data contained in incoming checks in a check lot. Check lots are special payment lots that contain only checks.
- You can enter the data from credit card payments manually in the credit card lots, or by using an interface.
- You can enter data from incoming bank transfers in a payment lot manually or automatically, or you can transfer the data from an electronic account statement to a payment lot using an interface.

Payment lots contain both general data and line item data. General data includes the status of the lot, the total of the payment amounts and default values for the line items. The line item data comprises the following:

- Data for a payment that is required for further processing, such as the payment amount and bank data

  Here, you can enter the bank number and bank account number, or specify the BIC and IBAN commonly used in international payment transactions.
- Selection criteria by which the payment is assigned to open items

If you enter a payment lot manually, you must specify the selection criteria in each payment lot item. This can be, for example, a document number or a payment form number. Where payment lots are created automatically, the selection criteria are determined from the data in the account statement.

When processing the payment lot, the system uses the selection criteria to determine the open items. Assignment of the payments to the open items is governed by industry-specific rules. Clearing of the assigned items takes place automatically.

Overpayments can be posted as payments on account; underpayments posted as partial payments. The system posts clarification cases to separate clarification accounts and you have to postprocess them manually. If you are unable to assign payments received, you can initiate repayment within the payment lot provided qualified bank data exists. The payment program then repays the amounts.

Check lots can be used to create check deposit lists that you can send to your bank as an accompanying document when depositing the checks.

Industry Component Utilities (IS-U)

You can also post incoming and outgoing payments individually in the cash desk. The lock documents generated in a dunning run are removed when all items that caused the lock are cleared. For more information about locking/restarting a utilities installation in the dunning run, see Industry Component Utilities > Contract Accounts Receivable and Payable > Lock/Restart. For information about the workflows for locking/restarting, see the Industry Component Utilities > Customer Service > Lock/Restart Utilities Installation.

Industry Component Telecommunications (IS-T)

You can also post incoming and outgoing payments individually in the cash desk. If an overdue item is paid that led to the deactivation of a service during a dunning run, the information about the clearing is forwarded to the billing system, which triggers the release/reconnection of the service.

Payment Lot Functions

The following table shows the functions available for processing payment lots.

Functions	Information
Create	You enter payment lots manually if the payment information exists in document form. This is normally the case for check payments, although incoming bank transfers can also be entered manually. When you create a payment lot, you assign a key to each lot, and enter header data, and a payment lot item for each payment (see Creating Payment Lots Manually). During manual and automatic creation of payment lots, the system can propose a key for the payment lot if you register an appropriate function module in Customizing for event 0211.
Save	To be able to process the payments you entered further (closing, changing, and posting), save the payment lot. If a payment lot is particularly large, you should save your data regularly during the entry process.
Close	Once all payments for a payment lot have been entered correctly, close the lot. Once you have done this, note that you can neither delete payments from the lot, nor add new payments to it. You can, however, change payments it contains. You have to close payment lots before you can post them.
Display	To check payments posted in a lot, you can display the lot and payment lot items. From the payment lot item display, you can: • Reset a payment assignment (menu: Goto > Reverse Payment Assignment) • Go to clarification processing if the payment could not be completely assigned (menu: Goto > Clarification) You can also display lots that have already been archived.
Change	Provided no postings have been scheduled or have taken place, you can: • Enter additional payments, change or delete existing payments • Change the entries in the fields Company Code, Business Area, Document Type, Posting Date, Document Date, and Value Date in the payment lot header using the function even if items already exist for the lot. When you save, the new values are inherited by all payment lot items.
Post	Once you have finished processing a payment lot you can close and post it. When a payment lot is posted, the payment amounts are transferred from the incoming payment account to the contract accounts. If an amount paid cannot be automatically assigned to an item, this amount is posted to a clarification account. The payment is then included in the clarification worklist. In the case of check lots, an additional posting is normally made by which a transfer posting of the total amount of the payment lot is made from the incoming check account to a clearing account for incoming checks. In the header of a check lot you can also specify that no posting is entered for a check deposit using the total amount of the lot. In this case, specify the check clearing account in the lot header, not the check deposit account. For more information see the field help for the Without Posting for Check Deposit field. You define default values for the Without Posting for Check Deposit field in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Define Default Values for Check Lots. This procedure is described in Posting Payment Lots. If errors occurred during posting, the payments within the payment lot can be postprocessed.

Functions	Information
Open	A lot that has already been closed, and for which no postings have been scheduled or made, can be reopened for corrections before posting. To open a payment lot in such a case, you need special authorization for object F_KK_SOND with activity 011.
Postprocess	If, when posting a payment lot, payments were posted to a clarification account or errors occurred, you can: • Postprocess the erroneous payments for each individual payment lot • Postprocess all payments containing errors (possibly restricted by selections) using the clarification worklist For more information about how to proceed, see Postprocessing Clarification Cases.
Create Check Deposit List	You can create check deposit lists for check lots. For more information, see Creating Check Deposit Lists.

ℹ Note

Since payment lots are generally created and posted automatically, the functions **Create**, **Save**, **Close**, and **Post** are also available automatically (see Creating Payment Lots Automatically).

You enter incoming checks manually in check lots. Check lots are special payment lots that are created to post check payments. For more information, see Creating Payment Lots Manually).

You can create lots for credit card payments manually, or using an interface.

The following functions are used for further processing of single payments in payment lots.

Function	Activities
Trigger repayments	If a payment was made by mistake and you wish to repay the amount, you can initiate the repayment when creating a payment lot. See Creating Payment Lots Manually. The payment program then automatically repays the amount.
Post to clarification account	When you create a payment lot, you can specify that the payment is posted to a clarification account if its purpose is not clear (see Creating Payment Lots Manually). The payment is then included in the clarification worklist for subsequent checking.
Post payments on account	If you know the contract account to which a payment is to be posted, but cannot assign the payment to an open item, you can post it as a payment on account (see Creating Payment Lots Manually).
Transfer payments	If a payment is intended for a different department that does not enter and process its incoming payments in the same system, you can enter a short account assignment to transfer the payment to a general ledger account. This serves as a clearing account. You can specify the short account in the **Transfer To** field.

Function	Activities
	You maintain the corresponding short accounts in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > Define Short Account Assignments for Transfer Postings. **Authorization for transfer** You can protect the access to transfers by assigning an authorization group in this activity at short account assignment level. The user then needs authorization for authorization object F_KK_KUKON. Transfer with tax If you assign a tax code to a short account assignment here, the system reduces the amount of the posting automatically by the tax portion and creates separate tax items provided the taxes are not dependent on a jurisdiction code in the country concerned. See also the documentation for the fields concerned.

Processing Payment Lots Manually

Prerequisites

The system posts payments that cannot be uniquely assigned to a contract account to a clarification account. You define this account in Customizing (see the Implementation Guide for Contract Accounts Receivable and Payable , Business Transactions > Payments > Processing Incoming/Outgoing Payments > Define Clarification Accounts). If however, you are entering a payment lot item manually, you can enter the account number directly in the line item.

If, for credit card payments, you forward the data to a specific card organization immediately, you can suppress the check of the validity period and the cardholder in Customizing. To do this, in the Implementation Guide for Contract Accounts Receivable and Payable choose Business Transactions > Payments > Incoming/Outgoing Payment Creation > Payment Cards > Define Accounts for Payment Card Organization and set the the No Validity field to Xfor the organization concerned.The system then no longer requests validity information when you enter credit card lots for this credit card organization.

Features

Notes on the list screen

You can enter payment data on a detail screen or on a list screen. The list screen provides you with one line per payment in which to enter the payment data. To ensure the most effective data entry possible, in Customizing you should define a screen variant that contains the main fields, such as payment amount, business partner, check number (see Implementation Guide for Contract Accounts Receivable and Payable , Business Transactions > Payments > Incoming/Outgoing Payment Processing > Define Screen Variants for Payment Lots). Fields that are not currently required are hidden automatically. For example, the column Document Number is hidden during data entry. The column Check Number is also hidden automatically if the lot processed is not a check lot.In Release 4.71, the entry and processing of payment lots has been changed over to Table Control . Therefore, you can no longer use the old screen variants that you used up to Release 4.64 if you upgrade; you have to create new variants. You can use report RFKK_VAR_MIGRATE to migrate old variants. Since the old variants had a five character key, but the new ones have only a three character key, the program changes the key where necessary. In the simplest case, the key is simply cut off after the first three characters. The variant names remain unchanged. If a payment lot is to be processed and no variant has been created at this

stage, the system automatically generates the variant SAP; you can use this to process payment lots, check lots, and credit card lots.

Notes on the detail screen

You use the detail screen if you need to enter more information than is possible on the list screen. This can be the case in the following circumstances:

- The list screen does not contain all the fields you require (for the clarification account or for details on repayment, for example).
- You want to distribute the payment amount over several contracts, contract accounts, or business partners since the business partner has specified this on the transfer medium or check.

  For payments for which you want to enter several selections, you can use an entry screen on the tab page **Selections** .

Notes for enhancing the screens

Using the customer include CI_FKKZP, you can include additional fields on the detail screen and the list screen. To do this, provide an include screen. The program name and the number of the include screen are determined in event 0222. For more information see the documentation and the coding examples in the related sample function module FKK_SAMPLE_0222.

On the detail screen, you can also define an installation-specific additional function. This function is in the menu of the standard delivery under **Extras** > **XXX** . You can also connect the function to a separate button. Event 0232 determines which function module is to be called when the user executes this function, and also determines the texts for the processing menu and the function key (xxx). For more information, see the documentation for the sample function module FKK_SAMPLE_0232.

Activities

You enter payment lots manually if the payment information exists in document form. This generally applies to check payments. You can also enter incoming transfers manually.

1. Choose one of the following paths:
   - **Role** **Incoming Payment Processing(SAP_FI_CA_INCOMMING_PAYMENTS)** > **Process Payment Lot/Process Check Lot/Process Credit Card Lot**
   - **SAP Menu** **Payments** > **Payment Lot/Check Lot/Credit Card Lot**
2. Enter a unique key for the payment lot, and choose **Payment Lot** > **Create.**
3. Enter the control totals. State the total amount and the number of payments. (This step is optional).
4. Enter the header data. This includes the following information:
   - Details for the documents to be posted:

     Document type, posting date, document date, currency, G/L reconciliation key
   - Details for postings to the bank clearing account:

     Account number, company code, business area, value date
   - Details for the selection criteria to be used:

     Business partner, contract account, document number, payment form number, payment advice note
5. Choose **Edit** > **New Items.** .The list screen for entering payment data appears.

Enter a line item in the payment lot for each payment (see Entering Selection Data for Payments). You must enter the payment amount and selection criteria for the open items.

In the case of check lots, you must also enter the check number. Further information will assist your efforts to clarify payments. For example, you could enter such additional data as the note to payee specified and the bank data for the check.

For credit card lots, you have to enter the credit card company and the card number. If master data already exists for the card in the system, or payments have already been made with this card, the data is completed automatically. If this is not the case, then you have to enter the cardholder, the validity period (valid from/valid to), the authorization number, and the authorization date and time explicitly.

You can determine the further processing of a payment as follows:

You want to	Proceed as follows on the detail screen:
Post a payment as payment on account	Select the field **Post on Account** .
Clarify a payment because you cannot assign it uniquely	Select the field **For Clarification** . You define the clarification account in Customizing. If you want to post an amount to an alternative clarification account, enter the number of this account in the **Clarification Account** field.
Initiate repayment of a payment amount	Select the field **Repayment** and enter the **Repayment Method** you require, together with the necessary bank data. If you enter a repayment method for which address data is required in the clarification – for example, check – you have to enter this data in a separate dialog box.A repayment by transfer is made to the bank details specified in the payment lot item as standard. If repayment is to be made using alternative bank details, or the bank details are missing in the payment lot, you can enter the bank data of the recipient in an additional dialog box. To assign alternative bank details, you need authorization for activity 13 of authorization object F_KK_SOND.
Transfer a payment to a clearing account	In the field **Transfer Posting To** , enter the required short account assignment for the required account. You define the relevant short account assignments in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Business Transactions > Payments > Incoming/Outgoing Payment Processing > Define Short Account Assignments for Transfer Postings** .
Transfer a payment from a payment or check lot that you cannot assign to clarification processing and thereby remove it from the clarification worklist	Specify the **clarification account** .

Once you have entered all your payments, you can save your entries. To do this, on the **Process Payment Lot: Payments** screen, choose **Payment Lot > Save** . You can now change, close, and post the payment lot. You can access these functions on the initial screen of the transaction. To access the initial screen, choose **Payment Lot > Other Lot** . If you do not need to enter any further payments or delete payments entered, you can close the payment lot. To do so, choose **Payment Lot > Close** . You can then post the payment lot. To do so, choose **Payment Lot > Post.** For more information, see Posting Payment Lots

Entering Selection Criteria for Payments

In each payment lot, you enter the selection criteria by which the system is to select those open items for clearance. Whether or not these items are cleared depends on your Customizing settings for clearing control (see Automatic Assignment of Open Items

).

Notes on selection types

The list screen contains up to three pairs of fields each titled T (selection category) and Field Value . A selection category represents a specific field that the system can use to select open items. (G for business partner or K for contract account for example). By combining the selection category and field value fields, you can specify different fields for each payment in the list without needing to use different input fields.You define the selection categories and any default values necessary for the selection categories in Customizing. Default values also appear in the payment lot header itself. You can define these in Customizing and thereby reduce the manual entries (see the Implementation Guide for Contract Accounts Receivable and Payable > Basic Functions > Open Item Management > Define Selection Categories and BusinessTransactions > Payments > Incoming / OutgoingPayment Processing > DefineDefaultValuesforPaymentLots) .You can define those selection categories that you use most frequently in the header data for the payment lot. The system then automatically defaults these categories for each payment.

Notes on the selection criteria on the detail screen

When entering your selection criteria on the detail screen, note the following:

- Selection conditions that you enter together must be fulfilled simultaneously if the open item is to be selected. These conditions are linked with a logical “AND”.

  Selection by payment form number and payment form reference are treated differently. Additional criteria that you enter in the same line are not linked with AND; they are ignored in the selection of open items. The open items concerned are determined uniquely via the payment form selected.

  If the items belonging to the payment form have already been cleared in some other way, and should therefore be posted on account, you can evaluate additional details for postings on account.

- Where selection criteria appear below one another, only one condition need be fulfilled for an open item to be selected.

  A customer specifies on the payment medium that they are paying the amounts due for contract numbers 5812 and 5814. You therefore need to find open items posted to contract 5812 or contract 5814. To find these items, you enter the two selections **V** 5812 and **V** 5814 in two different lines on the detail screen.

- If the payment medium contains additional details as to how the payment amount is to be split between items, you can assign a partial amount to each item selected.

  A customer pays an amount of 500, of which 200 is for contract 5812 and 300 for contract 5814. In this case, you enter these amounts in the selection lines in the Partial Amount column .

Splitting a payment amount

If, in the note to payee, the business partner specified more than one contract, contract account, or invoice for which the payment is to be used, you may have to split the payment amount. Proceed as follows:

1. On the Payment screen, enter the payment amount and the first selection line.
2. To branch to the Details screen, double-click on the line.
3. You can now enter the additional selection criteria (for example, one or more contracts, contract accounts) specified by the business partner in the note to payee.
4. If necessary, assign a partial amount to each item selected on the detail screen.

This may be necessary if the business partner specified exactly which partial amounts were to be assigned to which items in the note to payee.

Creating Payment Lots Automatically

Use

You can create payment lots automatically if your account statements are available as file. You can also create payment order lots and returns lots.

Procedure

There are different procedures for creating payment lots, payment order lots, or returns lots based on an account statement. To decide which procedure to use, you must first check which situation applies to you:

- The transactions in the bank account must be posted in different systems.

   Contract Accounts Receivable and Payable , General Ledger Accounting , and Accounts Payable Accounting run in separate systems. Incoming payments and returns for debit memos are to be process in the Contract Accounts Receivable and Payable system, outgoing transfers and debit memos in the General Ledger Accounting system.

- The transactions in the bank account can be posted in one system.

Postings in Different Systems

Use

You post and process incoming payments and returns for debit memos in Contract Accounts Receivable and Payable (FI-CA) and outgoing transfers and debit memos in General Ledger Accounting (FI-GL).

Activities

1. Create a program that extracts the incoming payments to be posted in FI-CA from the account statement. This program creates a file whose records correspond to a record structure defined by SAP.
2. Using the following standard report you create a payment lot from the file created under 1. From the SAP menu, choose one of the following paths:
   - **Role** Transfer Bank Account Statements(SAP_FI_CA_BANK_ACC_STATMENT) > Payment Lot Transfer
   - **SAP Menu** Periodic Processing > Transfer Data > Payment Lot > Transfer

     The program documentation contains a description of the data formats to be used and notes about auxillary programs that you can use to create test data and test datasets.
3. If you need to postprocess errors from the transfer, choose one of the following paths:
   - **Role** Transfer Bank Account Statements(SAP_FI_CA_BANK_ACC_STATMENT) > Error Processing forPayment Lot Transfer
   - **SAP Menu** Periodic Processing > Transfer Data > Payment Lot > Process Errors

Postings in One System

Use

You can post all transactions of the bank account in one system.

Prerequisites

You have configured a separate account only for money transactions processed in **Contract Accounts Receivable and Payable** (FI-CA) (incoming payments, payment orders).

Activities

You can use the following options:

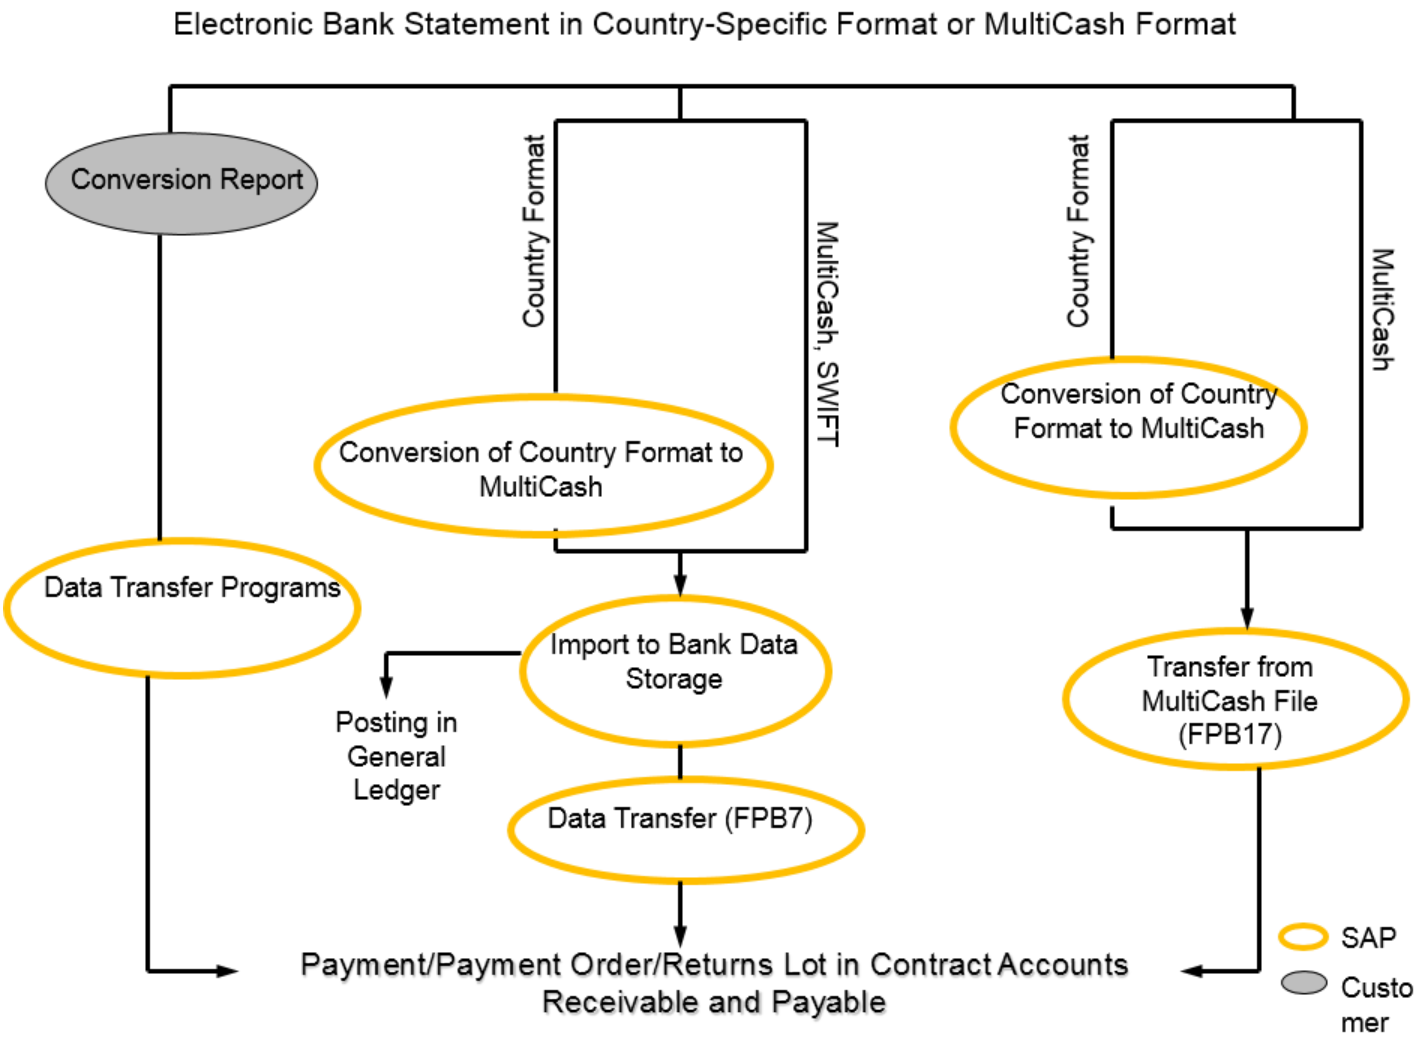

- You can load the account statement into the bank data storage of **Cash Management** . From there you use a standard program to transfer the translations relevant for FI-CA to payment lots, payment order lots, returns lots, or check management of FI-CA (see below). To create the lot in FI-CA based on the account statement in the bank data storage, in the SAP menu choose **Periodic Processing** > **Transfer Data** > **From Electronic Account Statement** .
- The bank account contains only transactions that are to be processed in FI-CA, so no check deposits, for example, and the file is available as MultiCash file in SWIFT MT940 format. In this case, you can use the file to create payment lots, payment order lots, and returns lots with a standard program. In the SAP menu, choose **Periodic Processing** > **Transfer Data** > **From MultiCash File** > **Transfer Data from MultiCash File.**

  A similar procedure is possible for certain country-specific formats. You first have to create a MultiCash file from the file in country-specific format, and then transfer it as described above. To convert the file in country-specific format into MultiCash format, in the SAP menu choose **Periodic Processing** > **Transfer Data** > **From MultiCash File** > **Convert Country-Specific Formats to MultiCash** .

  You can see the formats for which SAP supports this procedure in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Business Transactions** > **Payments** > **Processing Incoming/Outgoing Payments** > **Define Programs for Conversion of Country-Specific Forms to MultiCash** . By setting the indicator **RNA** in this activity, you can exclude certain programs from the display in the transaction **Convert Country-Specific Formats to MultiCash** and add own programs.
- Using your own program, from the account statement you create an extract that contains only those transactions that are to be included in a payment lot. The procedure corresponds to the case described in the section Posting in Different Systems .

For more information, see the report documentation.

Trasfer of Electronic Account Information to Contract Accounts Receivable and Payable

Transfer from Bank Data Storage

Purpose

Transfer of data from electronic account statements using the bank data storage of the component Bank Accounting (FI-BL).

Prerequisites

You have made the system settings for the electronic account statement in the Implementation Guide for Financial Accounting under Bank Accounting > Business Transactions > Payment Transactions.

Define and classify the external transaction codes of the electronic account statement that you want to transfer to FI-CA as Payment or Return in the Implementation Guide for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming/Outgoing Payments.

Process Flow

The electronic account statements are processed using the Bank Accounting (FI-BL) component of Financial Accounting as follows:

1. Call electronic account statement from house bank.

2. If the data is not available in MultiCash format, convert the data to MultiCash format using one of the standard programs provided by SAP or a customer-defined program.

   You can import data in MultiCash format into the bank data storage immediately; SAP provides formatting programs for numerous other formats.

   For the SWIFT format SAP certifies the SWIFT MT940 interface (FI-SBS). Certified banks or software providers provide files in SWIFT MT940.

3. Provide the data in a file system or PC drive.

4. Import the data, interpret the data, and save the information in the bank data storage of the component **Bank Accounting** (FI-BL) with report RFEBKA00.

   The systems performs a posting of the form bank to bank clearing account if you have specified this in Customizing.

5. Select payments, returns, payment orders, and check deposits from the bank data storage and enter them in the relevant lots using transaction FPB7.

To display the account statement data held in the bank data storage, from the SAP menu choose **Accounting** > **Financial Accounting** > **Banks** > **Incoming** > **Account Statement** > **Display** .

For more information about the electronic account statement, see the documentation for **Financial Accounting** under **Bank Accounting (FI-BL)** > **Electronic Account Statement** (FI-BL). See also the documentation for report RFEBKA00 and transaction FPB7.

Transferring Data from MultiCash Files

Use

Import of electronic account information from banks in payment and returns lots in **Contract Accounts Receivable and Payable** (FI-CA).

Prerequisites

The files exist in MultiCash format.

If you do not receive your account statements in MultiCash format, define or activate the programs for converting the payment media formats to MultiCash in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Business Transactions** > **Payments** > **Processing of Incoming/Outgoing Payments** > **Define Programs for Conversion of Country-Specific Formats in MultiCash** .

Features

FI-CA provides a program that you can use to import the payment information that is available in MultiCash format into payment and returns lots in FI-CA.

If your house bank delivers account information in a country-specific format and not MultiCash format, FI-CA provides conversion programs for some standard formats – you can use these to convert the data to MultiCash.

Activities

1. If the account information is not available in MultiCash format, convert the file to MultiCash.You can access the programs that you entered or activated in Customizing in the SAP menu under Periodic Processing > Transfer Data > From MultiCash File > Convert Country-Specific Formats to MultiCash. Select the required program by doubleclicking it.

   For more information about the conversion programs provided by SAP, see the documentation for the respective program.

   If the electronic account statement is already available in MultiCash format, no conversion is necessary and you can import the data directly.

2. Import the MultiCash file to payment and returns lots in FI-CA. In the SAP menu, choose Periodic Processing > Transfer Data > From MultiCash File > Transfer Data from MultiCash File.

   See the report documentation.

To create a posting of the form bank to bank clearing account in the general ledger, you also have to import the file to the general ledger in a further activity.

Transfer with FI-CA Data Transfer Programs

Use

Transfer of account information to payment and returns lots using the FI-CA data transfer programs.

Prerequisites

In Customizing for Contract Accounts Receivable and Payable under Data Transfer, you have made all settings for the transfer of data from external systems.

Features

You can import the account information provided by your house bank in electronic form into payment lots, returns lots, checks lots, and payment order lots using the data transfer programs used by FI-CA.

Activities

1. Write a program that you can use to provide the account information to be transferred as a sequential dataset in a format defined by SAP.

   If you want to use your own transfer structure, adjust the structure to meet your requirements. To do this, in the Generate Structures for Transfer of Data Customizing activity, copy the structures delivered by SAP to the customer namespace and adjust the copy to your requirements. In the copy you can remove fields not required from the structure and determine the order of the fields.

2. To transfer data, on the SAP Easy Access screen, choose Periodic Processing > Transfer Data > Payment Lot > Transfer.

3. You can postprocess any errors that occur during the transfer. Choose Periodic Processing > Transfer Data > Payment Lot > Process Errors.

For more information, see the documentation of the programs and Payment Lot Functions.

Determining Selection Criteria Automatically

Use

To reduce the number of items requiring clarification, selection criteria such as business partner or contract can be automatically determined during the transfer of payment data as follows:

- In the case of a standing order (can be identified by the BFKKZP-XDAUB = "X" field), the system first checks whether a standing order belonging to the same bank account with the same entry in the note to payee has ever been clarified.
- For other payments and for standing orders that have never been clarified, the text in the note to payee is analyzed to derive selection criteria such as business partner, account number, contract number, or document number.

If the structure of the ordering terms and thereby the rules for determining the selection criteria are company-specific, you can determine the selection criteria in a customer-specific function module.

Prerequisites

In order to be able to determine the selection criteria automatically when transferring payment data, the following prerequisites must be fulfilled:

- The selection criteria do not already exist in the dataset transferred.
- You have defined the interpretation rules for the analysis of the note to payee field in the Implementation Guide for Contract Accounts Receivable and Payable > Business Transactions > Payments > Incoming/Outgoing Payment Processing > Define Interpretation Rules for Note to Payee). In the activity Test Interpretation Rules for Note to Payee , you can test these settings, even if you have not carried out a payment run yet.
- In order for the system to check whether a standing order was ever clarified, there must be an “X” in the BFKKZP-XDAUB field.
- In the Implementation Guide for Contract Accounts Receivable and Payable : Program Enhancements > Define Customer-Specific Function Modules , you have not defined a customer-specific or industry-specific function module for event 0950. If the industry-specific function module is not to be used, define the standard function module FKK_SAMPLE_0950 as a customer-specific function module.

If you want selection criteria to be identified as installation-specific, program a function module and define it for the event (see the Implementation Guide for Contract Accounts Receivable and Payable > Program Enhancements > DefineCustomer-Specific Function Modules). This, however, renders the SAP function ineffectual.

Evaluating the ‘Note to Payee’ with Incoming Payments

Use

Using this function, you can evaluate and process the note to payee specified for the payment when copying data from FI account statements to the payment lot. The function is only available in Public Sector Contract Accounting.

By using interpretation rules defined in the Customizing of Contract Accounting , you can transfer incoming payments that have a particular sample in the ‘note to payee’ to a clarification account or a short account. The program enters the short account assignment or the status “to clarify” in the payment lot. This ensures that these payments do not execute clearing control. This is of interest for holding processes or for payments that have no requests.

Prerequisites

The evaluation of the 'note to payee' on incoming payments uses the IMG activities **Define InterpretationRules for Note to Payee** and **Process Selected Values from the Note to Payee** . You can read about other prerequisites and the functions of these IMG activities in the IMG documentation.

Features

How the program derives selection criteria for the open items from an incoming payment's 'note to payee' is described in the documentation on function module FMCA_EVENT_0950.

As well as transferring to a short account assignment or a clarification account, you can reassign the selection values found; in other words, you assign a new value or also a new selection category to a selection value.

You can carry out a check on the values that the program finds using the rules defined and in this way check the validation of what is specified in the 'note to payee'.

During the interpretation of the note to payee, the program evaluates the interpretation rules which were defined in Customizing of **Contract Accounting** . The system writes **all** entries it recognizes because of these rules in a table. These selection values are then restricted even more with standard function module FMCA_CHECK_SELECTION_0221, which is processed with event 0221. This function module checks whether there are selection values for short account/clarification account or new field allocations. If there are several values for a payment, the ranking order is taken from the definitions made in the IMG activity **Maintain Selection Values from Note to Payee** . If several selection values exist for the same sample, the selection value with the highest ranking is used, while other selections for the short account or clarification account are deleted from the selection values.

Example

You can find an example of this under Example: Interpretation of Note to Payee .

Example: Interpretation – Note to Payee

In the Customizing of **Contract Accounting** , the following entries exist for the IMG activity **DefineInterpretation Rules for Note to Payee** :

IMG settings for interpretation rules for note to payee

	Cash reference number	**Clarification account**	**Short account**
Key word	No entry	No entry	No entry
Structure	Digits only	Digits only	Digits only
	Length: 13	Length: 6	Length: 4
	Min.: 0000000000000	Min.: 000000	Min.: 0000
	Max.: 9999999999999	Max.: 999999	Max.: 9999
	Check procedure according to module11	No check procedure	No check procedure
Selection category	O	H	G

By using the electronic account statement, incoming payments that display the following specifications in the note to payee, are played in the system:

Specification in the note to payee on the incoming payment

Payment number	Note to payee specification
1	1234567890123; 2002; 210345
2	1235798645010; 2001; 210999
3	1236598645999; 2001; 212345
4	1225798645191; 2002; 213345

The following values are saved in a table for these specifications, based on the above-mentioned settings defined in the IMG.

Saved table values for incoming payments

Payment number	Selection value/Selection category
1	1234567890123/O; 2002/G; 210345/H
2	1235798645010/O; 2001/G; 210999/H
3	1236598645999/O; 2001/G
4	1225798645191/O; 2002/G; 213345/H

In the IMG activity, Process Selected Values from Note to Payee , the selection, order 1, clarification account 2, short account 3 was defined. The following settings were also defined:

IMG settings for selection values from the note to payee

Selection category	Sample	Account	Miscellaneous
O	1234567* 123*	Short account 0002 Clarification account 113201	Priority
G	2002	Clarification account 1132002	
H	21* 213*	Clarification account 113201 Short account 0002	

The following results from the payments:

Payment 1 is transferred to short account 0002. The specification for the clarification accounts for selection category G and H have no effect because the short account takes priority. **Payment 2** is transferred to clarification account 113201. **Payment 3** cannot be assigned because the selection value for selection category O did not pass the check digit procedure. **Payment 4** is transferred to clarification account 1132002 because the clarification account takes precedence over the short account.

Posting Payment Lots

Prerequisites

You have closed the payment lot.

Procedure

You post a payment lot manually if you entered and closed the payment lot manually or if the payment lot was created automatically, but not posted.

1. Choose one of the following paths:

- **Roles**

Incoming Payment Processing > (SAP_FI_CA_INCOMMING_PAYMENTS) > Process Payment Lot/Process Check Lot

- **SAP Menu**

Payments > Payment Lot/Check Lot

1. Enter the key of the payment lot.

1. Choose Payment Lot > Post .

   The Post Payment Lot dialog box appears.

1. Specify when and in which mode the postings are to be made.

   In the case of larger payment lots, you should execute the postings in the background; otherwise it is essential that the dialog box in which you are working is blocked for the duration of the postings.

1. Choose Continue .

   The system issues a message when the posting run is completed.

1. Now check the status of the payment lot.

Result

The status of the payment lot indicates which activities you now have to carry out:

- Postings made : All payments were posted. No clarification cases have arisen. The reconciliation key for postings to the general ledger was closed, meaning that data can be transferred to the general ledger.
- Postings made, postprocessing necessary: Certain items require clarification. Postprocessing is necessary either because one or more payments were posted to a clarification account or because the system was unable to make a posting due to incomplete settings in Customizing. These payments are automatically included in the clarification worklist. For more information, see Postprocessing Clarification Cases .

Clarification Processing (Payment Lot)

Use

Clarification cases arise where you post a payment lot but either some or all payments could not be posted to a contract account. This could have resulted from payment details or Customizing settings being incomplete or incorrect, or when you entered a payment you marked it as “to be clarified” immediately. When you post a payment lot, the clarification cases are posted to a clarification account and included in a clarification worklist instead of being posted to a contract account. You perform transfers from a clarification account to a contract account in the clarification worklist. You can carry out postprocessing for a single payment lot or for all clarification cases (for more than one payment lot).

Postprocessing can be supported by using SAP Cash Application, add-on for contract accounting (requires an additional license).

Prerequisites

There are unassigned payments to be transfer posted to contract accounts. Customizing settings for processing clarification worklists are provided by SAP (see Customizing for Contract Accounts Receivable and Payable under **Technical Settings** > **Prepare Processing of Clarification Worklists**). Check, overwrite, and add to the default values as needed. At this point, you can choose selection fields for clarification case processing. If clarification cases have arisen due to erroneous or incomplete Customizing, you should first check and amend these settings (see also Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Processing Incoming/Outgoing Payments**).

Features

In Customizing, you can use a role definition (similar to SAP workflow) to assign an agent to individual clarification cases in the clarification worklist. This agent then receives only those clarification cases in his or her clarification worklist for which he or she is responsible within the organizational structure linked to the role. The system evaluates the units of your organizational structure to determine the clarification cases needing processing. For more information about role definition in SAP Workflow, see Role Definition. This assignment is optional. Clerks can limit the number of clarification cases for processing with selection criteria. For example, they can specify a company code after calling the function for clarification processing. You define the fields that are displayed on the selection screen in Customizing. Clarification cases can be processed by several agents in parallel. You can reserve clarification items in the clarification worklist for a particular agent, thereby preventing them from being processed by other agents. An agent can choose to cancel this reservation. You can also impose a time limit on locks in Customizing. After the lock has expired, the clarification cases can be accessed by all agents (see Customizing for Contract Accounts Receivable and Payable under **Technical Settings** > **Prepare Processing of Clarification Worklist**). To refresh the clarification worklist you can either:

- Refresh the status information.

  This only updates the status of the individual clarification cases in the list. You can now see which clarification cases were locked or clarified by other agents since the previous update.

- Reselect the list.

  The system reselects items based on the selection criteria you entered on the selection screen when you first called up the list. If you choose reselection, those items that have been clarified or locked by other users no longer appear in the list.

For each clarification case you can display a detailed overview with the attributes. If you activated use of notes for clarification cases in Customizing, the system now displays notes for the clarification case. If the clarification case was locked by a user, you can add your own notes. You can clarify a payment lot item as follows:

- Correct the payment item (for example, selection specifications) and post items with no further dialog (see Postprocessing Clarification Cases).
- Manual posting and clearing (see Posting Clarification Items in Dialog)
- Create a repayment request if you cannot assign the payment amount received. In that case, the system makes a transfer from the clarification account to a clearing account for repayments (see Postprocessing Clarification Cases).
- Transfer to a clearing account by entering a appropriate short account assignment.
- When transferring payments to clearing accounts, you can automatically inform the clerk in the corresponding department. This information can either be sent by mail or by a workflow triggered by an event module. The number of the clarification document or the number of the repayment request is recorded in the appropriate line item in the payment lot.

Clarifying Partial Amounts

If you already know on the clarification screen the partial amount you can clarify, choose the **Partial Clarification** pushbutton. A field appears in which you can enter the partial amount. All further activities are the same as if you were clarifying the total amount. After the partial clarification, you do not automatically return to the clarification list; you remain on the detail screen for the partially clarified payment.

If you want to post the clarification amount online, and do not realize that you can only assign a partial amount until after you have selected the open items, proceed as follows:

- First, assign all open items.
- Then choose **Goto** > **Enter general ledger items** to obtain an overview of the general ledger items. Here you can see the line item created automatically for the clarification account. Change the amount here so that it matches the total of the items selected for clearing. If you post the document now, a partial clarification takes place.

All partial clarifications are recorded and you can display them on the **Partial Clarifications** tab when you perform subsequent clarifications or display the payment lot item. In a partial clarification, you can also clarify amounts that have exceeded the payment amount or have a different +/- sign to the payment amount.

Example

A customer pays 98 EUR, which is composed of 118 EUR residual payment for a loan minus 20 EUR credit memo for negotiating a new insurance contract. For the 118 EUR, you have to carry out a transfer while the credit memo for 20 EUR is to be cleared. You therefore have to post two partial clarifications for 118 EUR and -20 EUR.

Tools for Clarification

When you call up a clarification case, the system automatically offers you a clarification proposal. You can determine the scope of the clarification proposal in your personal settings. For the business partners proposed, you can also display their last payments and any due items, search for similar numbers (for example, document and account number), and switch the clarification processing screen to distribute the payment amount to several partners, contract accounts, or contracts. For more information, see the program documentation. Choose in the toolbar of the **Clarify Item: Details and Selections** processing screen.

The system also derives the clarification proposal from previous clarifications. The system determines all business partners/contract accounts/contracts, to which amounts were assigned for previous payments from the same bank account of the payer. For certain bank accounts (for example, social welfare office account), the payments may affect a number of different accounts. This means that the selection proposed is very extensive and not easily manageable. Therefore, if there are more than three results from previous clarifications, the system also checks the usage text to see whether the values determined for the business partner, contract account, or contract are specified there. The search tolerates certain errors in that it permits different ways of writing the same words (for example, with separators or blank spaces) and also accepts a maximum of one incorrect character. If, among the previous clarification cases, there are some where the note to payee details correspond to the selection criteria as described above, only these entries are proposed.

Queries for Clarification

You can create queries to the house bank or other addressees regarding a clarification case using the pushbutton. If you define the corresponding values in Customizing, the system automatically proposes a business partner and an application form for the correspondence:

- Enter the number of the business partner to be proposed (business partner that represents the house bank or a contact person at the house bank) in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Processing Incoming/Outgoing Payments** > **Define Bank Clearing Accounts for Payment Lot** in the **Correspondence Recipient** field. Maintain also the **house bank** and **account ID**, since the system uses these to determine the account numbers at the house bank that are to be specified on the correspondence (if necessary).

- You define the key of the application form to be proposed in Customizing for Contract Accounts Receivable and Payable, under Basic Functions > Correspondence > Define Application Forms for Correspondence under correspondence type 0035. Form `FI_CA_BANK_CORR_SAMPLE_SF` (Smart Form) is available as a sample.

Resetting Payment Assignments

If a payment has been assigned to different partners, contract accounts, and contracts, and some of these assignments are incorrect, you must return the amounts concerned to the clarification account. If open items were cleared by the payment, you can return the amounts to the clarification account by means of a reset or partial reset of the clearing with the Post Back to Clarification Account function. If the payment or a partial amount was posted on account, you can return the amount to the clarification account in the SAP menu under Account > Post Payment on Account Back to Clarification.

Special Considerations

If several days pass before the clarification of a payment, it might be the case that the posting date specified in the payment lot is no longer allowed because the related posting period is already closed. In such cases, the system determines a new posting date automatically. The system then determines the first posting period that is still open following the originally planned posting date. If today's date is in this period, the system uses today's date as the new posting date. Otherwise it uses the last day of the period.

Example

The planned posting date is 03/28/2014. The period 03/2014 is already closed. The posting periods correspond to the calendar months. Today's date is 05/02/2014.

If the period 04/2014 is still open, the system chooses 04/30/2014 as the posting date, because today's date is no longer in the period.

If the period 04/2014 is already closed and the period 05/2014 is open, the system chooses today's date of 05/02/2014 as the new posting date.

Instead of having the system automatically determine the new posting date, you can explicitly enter a different date during clarification processing. On the Clarification tab, choose the pushbutton. You enter the posting date in the screen that follows. You can assign a new date, even if the planned date is still allowed.

In addition, you can specify a posting date if clarification postings are necessary in different company codes and the system cannot automatically determine an alternative posting date.

Additional Functions

If you only want to display clarification cases that need processing immediately, you can use the function Only Urgent Clarification Cases on the selection screen of the incoming payment clarification. You can enter the specifications for the urgency of a clarification case in the system settings (see Customizing for Contract Accounts Receivable and Payable under Technical Settings > Prepare Processing of Clarification Worklist).

You can transfer bank details of business partners that you received during clarification processing to the business partner master records using the report Transfer Bank Data from Clarification Cases (transaction `FP05BNKD`, SAP Easy Access screen: Master Data > Business Partner). For more information, see the report documentation.

At event 0263, you can influence which information is transferred from the note to payee determined by the bank to the note to payee in the clarification case. By adjusting the data, you ensure that clerks find the details in the note to payee in the clarification list that you need for clarifying payment.

Defining New Reconciliation Keys

You can determine whether the postprocessing postings are made using the old payment lot reconciliation key or the new one. Since using a new reconciliation key involves closing the old reconciliation key first, this has the advantage that the postings made under the old key can be transferred to the general ledger.

To create a new reconciliation key for postings you make during postprocessing, proceed as follows:

1. Choose one of the following paths:

- **Roles**

Incoming Payment Processing > (SAP_FI_CA_INCOMMING_PAYMENTS) > Process Payment Lot

- **SAP Menu**

Payments > Payment Lot

1. Enter the key of the payment lot that you wish to postprocess and for which you want to assign a new reconciliation key.

1. Choose Edit > New Reconciliation Key.

You can close the old reconciliation key and assign a new reconciliation key for all payment lots that still contain clarification cases by using the following path, or by using the RFKKZSTF report.

- **Roles**

Transfer General Ledger and Profitability Analysis > (SAP_FI_CA_TRANSFER_GL_PROFIT) > Create New Reconciliation Keys for Payment Lots to be Clarified

The prerequisite is that totals records have already been recorded for the reconciliation key currently in use. For information on the rules according to which the new reconciliation key is created, see the documentation for the function module FKK_SAMPLE_0241.

If you want to use a different logic to the standard logic for determining a new reconciliation key, write a function module using FKK_SAMPLE_0241 as a reference, and define this at event 0241 in the Implementation Guide for Contract Accounts Receivable and Payable under Program Enhancements > Define Customer-Specific Function Modules.

Postprocessing Clarification Cases

Use

Postprocessing Clarification Cases in Payment Lots

Features

If you have authorization 107 for authorization object F_KK_SOND, you can make changes to fields in payment lot items during clarification. These fields are normally not allowed to be changed. In the case of automatically-created payment lots, you can change the bank data of the payer and the note to payee. These kind of corrections are necessary, for example, if a data reader did not correctly interpret some characters in a handwritten note to payee. The fields on the Payment Data or Note to Payee tabs become ready for input when you choose Edit > Change Bank Data on the detail screen of the payment lot item.

Activities

1. Depending on how you want to process clarification cases, choose one of the following paths.

   If you want to postprocess the clarification cases of a lot, choose:

   - The role **Incoming payment processing** (`SAP_FI_CA_INCOMMING_PAYMENTS`) and there choose **Process Payment Lot**
   - On the SAP Easy Access screen **Payments** > **Payment Lot**

   Enter the key of the payment lot and choose **Postprocess**.

   If you want to find a payment, choose:

   - The role **Incoming payment processing** (`SAP_FI_CA_INCOMMING_PAYMENTS`) and there choose **Find Payment**
   - On the SAP Easy Access screen **Payments** > **Clarification Activities** > **Find Payment** or **Find Payment (User-Defined Search)**

   After you have entered the selection criteria, this report searches for suitable payments in the payment lots. For more information, see the program documentation.

   If you want to call the clarification worklist, choose:

   - The role **Incoming payment processing** (`SAP_FI_CA_INCOMMING_PAYMENTS`) and there choose **Clarification Processing: Payment Assignment**
   - On the SAP Easy Access screen **Payments** > **Clarification Activities** > **Payment Assignment**

   Enter your criteria on the selection screen, and choose **Execute**. Note that clarification cases are filtered according to their status before they are displayed (for example, cases already clarified or those blocked by another user). This means that the full list of clarification cases might not be displayed.

2. Select the clarification worklist item you want to process, and choose **Edit** > **Clarify**. You can then use the following functions:

You want to	Proceed as follows
Post a payment	Normally you first have to correct your selections. You can now post the payment on account or with clearings. If you want to post on account, also select the **Post on Acct** field.
Transfer a payment	In the **Transfer Posting To** field, enter the key of the transfer account that is entered in Customizing.
Request a repayment	Select the **Repayment** field, and enter the repayment method along with the necessary bank data and the note to payee for the repayment.

3. If you have to assign the payment manually to the open items, you can post the item - once you have processed it by choosing **Edit** > **Post Item** or **Post Item Online**.

ℹ Note

In special circumstances, you can also post clarification cases automatically. For example, if clarification cases arose because invoices were not yet transferred to the system, you can use the Post Again function. A note text appears informing you when this approach is useful.

Search Using TREX

To be able to use the search engine, you have to create a search index and regularly transport entries that have been changed or added.

1. To do so, first set up a TCP/IP connection to the TREX server. In SAP Customizing, choose SAP NetWeaver > SAP NetWeaver Application Server > IDoc Interface/Application Link Enabling > Communication > Create RFC Connections.
2. Then make the necessary system settings using the administrative transaction `COM_SE_ADMIN`. Choose Goto > Customizing > System Settings to select a TCP/IP connection to the TREX server. Under Business Objects and Indices, check if the business object `CA_INCPAY` was already created. If not, create it. The class for this business object is `CL_FKK_SEARCH_PLOT`. See the documentation of the individual fields when making the settings for the object. This documentation offers guidelines for entering useful values. You can also create and activate the index in the transaction.
3. Specify the creation date, starting from which payment lot data is to be added to the search engine, and specify whether archived data is also considered during the initial upload. You do so in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > Parameterize Search Engine.
4. Create the initial search data using report `COM_SE_DISPATCHER`. You can also use the report subsequently for transferring changes to the dataset. Schedule this report to run in the background. For transferring changes, it is recommended that you schedule the report to run regularly (such as once or more each day) so that the search data remains as up-to-date as possible.
5. In the activity Parameterize Search Engine in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments, specify the date, starting from which you want the search to take place using the search engine. For more information about TREX, see the documentation for SAPNetWeaver under SAPNetWeaver by Key Capability > Information Integration under “Search and Classification (TREX)”.

Forwarding Clarification Cases

Use

Under certain circumstances, clarification cases cannot be processed immediately by a clerk. It may then become necessary to forward individual cases to other internal organizational units or actual clerks. To set up the forwarding process as efficiently as possible, you can use the functions described below.

Features

You can process a clarification case either as part of a workflow or forward it in an e-mail to the responsible clerk.

You can use the following sample workflows:

- In a simple workflow, the clarification case is put into the workflow inbox of a clerk. The clerk calls clarification processing and works through the case as accustomed. If the case can be clarified, the workflow finishes. If clarification fails, processing is called once more. The case is assigned to a different clerk. By making the appropriate assignment and restriction settings, you can ensure that the case is assigned to a new clerk.
- In an ad-hoc workflow, each clerk can forward the case directly to a colleague if clarification was unsuccessful. Forwarding to the case to another position or organizational unit is also a possibility. You do not need to assign or restrict accounting clerks for this workflow since the clerks are determined by direct entries. To do this, maintain the Workflow with direct switching setting .

SAP includes sample workflows WS21000078 (simple workflow) and WS21000077 (ad-hoc workflow) in the standard system. Use these workflows as a model for creating your own workflows.

Posting Clarification Items Online

Prerequisites

The payment lot must still contain payments requiring clarification; automatic assignment of the payment is not possible with the existing information. You have selected a payment requiring clarification.

Procedure

You are in a clarification worklist on the screen **Clarify Item: Details and Selections.**

1. Choose **Edit** > **Post Item Online** .
2. The document entry screen appears. You now have to transfer the payment amount from the clarification account to one or more suitable contract account(s). The posting with which the clarification account is credited is generated by the system. The selection criteria are proposed from the payment lot but you can overwrite them. Having entered your selection criteria, you can then assign clearing amounts to the open items. For more information, see Processing Open Items . If you want to post the payment amount or partial amount as a payment on account, choose **Goto** > **Back** to get to document entry.
3. Post the document if the balance is zero or the balance is within the tolerances permitted for an automatic write-off of the difference. To do so, choose **Document** > **Post.**

Result

Having posted the document, you automatically go back to clarification processing. The document number assigned is recorded as the clarification document number for the payment. Once you have processed the last item requiring clarification within a payment lot, the system changes the status of the payment lot to **Postings Made.**

Enhancements for Public Sector Contract Accounting

Use

In order to make it easier to manually assign payments that the program cannot assign automatically, you can use the fields **Clarification Account** (KLAEH) and **Name of Payer** (KOINH) in **Public Sector Contract Accounting** . This way, you can restrict the open clarification cases even more.

In addition to the standard roles, there are also two Public Sector-specific roles available in clarification processing, that you can use to determine the person responsible for open clarification cases automatically. This enables you to assign a clarification case to at least one agent or group of agents.

Prerequisites

You have defined the fields for processing the clarification worklist, provided you want to use this, as selection fields of the application object **Payment Lot** (PLOT) in the implementation guide of **Contract Accounts Receivable and Payable** , under **Technical Settings** > **PrepareProcessing of Clarification Worklists** .

You have activated the standard roles delivered in Customizing or have, if you do not want to use the standard roles, replaced these with Public Sector-specific roles and then activated them.

Features

The system copies the fields **Clarification Account** (KLAEH) and **Name of Payer** (KOINH) when generating clarification cases in the clarification worklist from the table **Payment Lot** : **Data on Payment** (**DFKKZP).** Both fields can be used to process the clarification worklist and define responsibilities for clarification cases when used with the standard roles.

Note

If necessary, you can include additional fields from table DFKKZP in the include CI_FKKZST and treat them the same way.

Payment Assignment (Processing the Clarification Worklist)

If you have activated the fields in the Customizing of **Contract Accounts Receivable and Payable** , they appear on the selection screen for processing the clarification worklist and can be used by all employees. In this way, all employees can select using a specific payer or clarification account. The result of the selection is a worklist that can be displayed in the **SAP List Viewer** . You can include both new fields in the display variant. This means you can sort the worklist by field or set a filter.

Example

If you want to search for specific payers, you must include the field **Payer** in a corresponding display variant.

Defining Responsibilities

If you want to assign clarification cases to certain employees or organizational units based on fixed derivation rules, you can use the standard roles delivered by SAP or Public Sector-specific roles to restrict your selections in the clarification worklist.For role definition (container or responsibilities), you can use all the fields in table **Clarification Cases from Payment Lot** (DFKKCFZST). You can change the role definition in the SAP menu, under **Tools** > **Business Workflow** > **Development** > **Definition Tools** > **Rules for Agent Assignment** > **Change** .

The standard roles for the clarification are defined in Customizing. You must activate them separately. If you want to use Public Sector-specific roles instead of the standard roles, you must replace the standard roles with the Public Sector-specific roles in the Customizing of **Contract Accounts Receivable and Payable** in IMG activity **Prepare Processing of Clarification Worklists** and then activate them.

Public Sector Contract Accounting provides the following roles:

- Selection restriction clarification worlist

  Role 02100008 (FMCA_PLOT_SR) defines, which organizational units, positions, persons or users can process particular cases in the clarification worklist. Preset container fields are **clarification account** , **payer** and **payment amount** . You can use the clarification account to transfer payments, posted on specific clarification accounts, to specific processors or organizational units. You can use the **payer** to distribute the clarification cases by the name of the payer to different agents. An example of this is under, Example: Alphabetical Allocation of Clarification Cases . **Payment amount** enables you to divide the clarification cases according to amount limits.

  ### Note

  In order to improve performance, you should delete all fields from the responsibilities and role container that are not used. Remember that the **Payer** field is not always filled (for example with cash payments). To assign these cases also to an agent, you must create an interval with the start value *.

- Restricting acute clarification cases

Role 02100009 (FMCA_PLOT_UC) defines when clarification cases in the clarification worklist should be regarded as urgent (acute) and which organizational unit, position, person or user is responsible for a particular clarification.

This role represents a restriction of the standard role 02100008 (FMCA_PLOT_SR); in other words, the agent needs access to the clarification cases, in order to have them displayed as " acute" when certain conditions are fulfilled (e.g. amount or posting date). Clarification cases that are not displayed for the agent because of his responsibility based on standard role 02100008 (FMCA_PLOT_SR) are also not visible to him via the **Acute** button .

Preset container fields are **payment amount** and **posting date** . Especially large amounts can be treated as "acute" in the clarification worklist using the payment amount. By using the **posting date** , you can select cases that are very old.

Example: Alphabetical Allocation of Clarification Cases

This example is based on the following: In a government agency, the agent Karin Jones is responsible for the personnel area A-D. All unclarified payment cases, that have an account holder name in the name interval A-D, should be assigned to her automatically.

- Define Public Sector-specific role 0210008 in Customizing

  In the Customizing of **Contract Accounts Receivable and Payable,** choose **TechnicalSettings** > **Prepare Processing of Clarification Worklist** > .

  Double click on the application object PLOT to get to the detail screen of the application object. In the group box **Role for Selection Restriction,** enter the Public Sector-specific role 0210008 and select the field **Active** .

- Maintain Public Sector-specific role 0210008

  In order to improve performance, you should delete all fields from the role container that are not used. Delete therefore the fields **Clarification account** (KLAEH) and **Payment amount** (BETRZ). To do this, in the SAP menu, choose **Tools** > **Business Workflow** > **Development** > **Definition Tools** > **Rules for Agent Assignment** > **Change.** Enter the Public Sector-specific role 0210008 and choose **Change** and reach the screen **Rule: Change** . Choose the tab page **Container,** delete the fields not needed and save the change .

  The responsibilities of Mrs. Jones are also defined on the screen **Rule: Change** . To do this, choose the tab page **Responsibilities** and then the button **Create Responsibility** . Enter the values from A to D for the field **Payer** , save and then go back.

  Note

  If you enter '* Until DZZZZZ' as the interval, Mrs. Jones receives all unclarified payments that have no entry in the field, **Payer** .

  To assign the responsibilities defined above to the agent, choose **Add Agent Assignment,** enter the position responsible for personnel area A-D as the position and choose **Create.**

  For this example, it is assumed that Karin Jones is created in the system as a user and this user has been assigned to the position "Personnel area A-D" in the agency's organizational unit. For further information on mapping organizational units, see the documentation on Organizational Structure .

  Note

  SAP recommends assigning responsibilities to an element of the organizational structure (such as a position). If you assign a responsibility directly to a specific user, you must change the assignment in all roles assigned to this user when the user's responsibilities change.

Administrator Function

Use

If the clarification worklist is called by a user that utilizes the administrator authorizations for clarification worklists, an additional function appears in the selection screen: **Execute in Administrator Mode**. Users that call up the clarification worklists in administrator mode can also use the following functions in the list of the clarification worklist:

- First time of assigning clarification cases to processors.
- Transfer of clarification cases from one processor to another
- Change of clarification case status

Prerequisites

To call up the clarification worklist in administrator mode, you must have the authorizations for the following activities of the authorization objects `S_CFC_AUTH`.

Parameters	Value
CFC_OBJAP	PLOT
BEGRU	*
ACTVT	70

Features

The filter is not used when selecting the clarification cases; all clarification cases this means all cleared and cases locked by other uses are displayed according to the selection criteria. You can also use the following functions for inbound correspondence:

- Using **Unblock**, clarification cases can be unblocked. These are all cases that are locked by other users but are not processed. This is necessary, if a colleague is off-sick and has locked the clarification worklist item. The process of unblocking allows other colleagues to take on the processing.
- Using **Block**, the colleague can lock clarification cases for other users. The administrator is entered in as processor. A new function for changing status and user changes of clarification worklist items is in the Menu. This enables the user to have a new status and username (processor) for the previously selected clarification worklist items. The entry of a user or status is optional. If the only the status is to be changed for example, leave the field **new username** blank. The function is used if clarification worklist items are explicitly assigned to another processor. If required the item as is also locked for other colleagues so that only the explicitly specified processor has access to it.

Organizational Structures

Features

You can structure clarification processing according to an organizational viewpoint. This would allow you to assign clarification cases to clerks by amount. In the following sections, this assignment concept will be explained along with the steps necessary to assign clarification cases.

Roles

Definition

A role describes an attribute or characteristic of a user from a commercial perspective.

Roles are formulated with reference to:

- One or more application objects.
- Application data.

Example

Role: Role: "Accounting Clerk Incoming Payment"

Use

Roles are used in payment processing to distinguish between or determine clerks processing clarification cases.

Structure

Each role has a **role parameter** defining the attributes by which restrictions for particular accounting clerks can be laid down.

Example

You can use the role parameters to define that the responsibility for a certain case is to be determined by the payment amount. Different responsibilities can be defined for each role for the "payment amount" attribute. For example, you could designate an amount from 0 - 1000 EUR for responsibility 1 and an amount from 0 - 1000000 EUR for responsibility 2.

Role Definition

Use

When you create a role definition, you define a role for use when processing items requiring clarification, such as payment lots.

You use this function if you need to define roles for the different types of clarification worklist processing.

Prerequisites

You have defined your organizational structure (see the section on organizational structures), which contains the clerk in charge of the clarification worklist .

Features

When you define a role, you specify which information (attributes of the clarification items to be processed) is to be used for role determination when you process the items for clarification. For a list of payments, this might be payment amount, company code or house bank.

This information comprises the role parameters. This information is the **Role parameter** and is defined as an element of the **Role parameter container.**

Defining Standard Roles

To create a new standard role, proceed as follows:

1. Choose one of the following paths:

- **Roles**

Business Workflow: Workflow Developer > Definition Tools > Standard Roles > Create

- **SAP Menu**

Tools > Business Workflow > Development > Definition tools > Standard roles > Create

Standard roles are always **client-independent** . There is currently no facility to define client-dependent roles.

1. Enter the required data on the Create Standard Role screen.

Note the following: The roles functions are used by other SAP components (primarily for SAP Workflow). You can therefore choose a role category.

1. Clarification worklist processing uses only the Responsibilities role category. Select the field Responsibilities .

1. Save your entry by choosing Standard Role > Save .

For identification purposes, the system assigns an eight figure number to each standard role.

Standard roles are linked to transport systems as client-independent transport objects.

Result

Having created a standard role, you must now maintain the elements in the role parameter container (see Maintaining Role Parameter Containers).

Role Resolution

Use

Determination of clarification case categories

- that have the properties described by responsibilities for the role, and
- to which the administrator is assigned (directly or indirectly, for example, by belonging to an assigned organizational unit).

Integration

Role resolution does not take place until runtime, depending on the current user and using information concerning responsibilities.

Example

Clarification worklist processing refers to the Clarification Specialist of <Payment Lot Item> role.

User Miller calls up stock processing. Mr. Miller is assigned to the "Small Amounts Processing" department in the organizational plan. This department processes clarification cases from payment lots up to an amount of EUR 1000. In the named role, the responsibility for amounts up to EUR 1000 is assigned to the "Small Amounts Processing" department. The role resolution provides this information and ensures that only clarification worklist items with amounts up to EUR 1000 are offered to the processor for processing.

Prerequisites

A role is

- defined with its role parameter container (see Maintaining Role Parameter Containers) and
- is defined with one or more responsibilities to which certain organizational units of the organizational plan are assigned (see Creating Responsibilities)

Features

Role resolution based on **Responsibilities**

For role resolution, an assignment table (responsibilities) is evaluated in which **Organizational Management objects** (jobs, positions, users, organizational units) are assigned to various values of the role parameters. This assignment table was set up explicitly while defining roles.

Role resolution without result

It is possible during role resolution that the current processor is not found to be a valid processor. This is the case if the following applies to role resolution:

- It runs with errors and does not return a result at all (incorrectly defined role)
- It proposes processors, but the current processor does not belong to this quantity, that is, no stock items can be processed by the current processor.

If necessary, check your definitions in these cases.

Role Determination

To determine roles, the system evaluates an assignment table in which the **Organization management objects** (jobs, positions, user, organizational units) are each assigned to the different role parameter versions.

This assignment table is created when you define roles.

Role Parameters and Role Parameter Containers

Definition

Containers, the elements of which define the parameters for a role. One role parameter container belongs to each role.

Use

During item clarification, role parameters contain the current, context-independent information that is used for role determination. These parameters therefore represent the "input" for role determination. This is the first step in defining roles.

Structure

Depending on the role determination procedure, the role parameter container can contain the following information:

Role determination using Responsibilities

Role parameters can be any table fields that are contained in the clarification table for the corresponding clarification processing (see the IMG structure Contract Accounts Receivable and Payable > Technical Settings > Prepare Processing of Clarification Worklist - (the system displays the same screen as for maintaining role definitions)). No other fields are permitted. Since role definitions are also used by other SAP functions, the system cannot check whether your entries are correct. For example, it cannot check whether the container definition was made with reference to the DDIC application table.

Maintaining Role Parameter Containers

Activities

To create a container definition, proceed as follows:

1. From the Create Standard Role screen, choose Goto > Container definition.
2. Choose Edit > Create.
3. A dialog box appears with the question: Create with ABAP Dictionary field proposals?
4. Answer this question with YES .
5. On the screen that is now displayed, enter the name of the application table. This name can be taken from your Customizing settings for the clarification processing application object (see the IMG structure Contract Accounts Receivable and Payable > Technical Settings > Prepare processing of clarification worklist (the system displays the same screen as for maintaining role definitions)).
6. Choose Continue .
7. The system displays all the table fields belonging to the application table.
8. Choose those table fields that you wish to use as criteria for defining responsibilities.
9. For each field you select, the system displays a create window, that must be confirmed by choosing Create.

Result

You must now maintain the responsibilities (see Creating Responsibilities).

Responsibilities

Use

A number of worklist items belong to a responsibility. This amount is defined using the selection criteria, which determine each amount uniquely. Selection criteria consist of a quantity of intervals expressed by the container definition attributes (application

table fields). If, for example, the container definition contains the attribute **Amount** , then you can restrict the number of items for clarification within a payment lot by specifying an interval of 0 to 1,000 EUR.

You assign organizational units of your organizational structure to this interval. For example, you could assign the "small amounts processing" department and its representatives to the interval from 0 to 1,000 EUR. Organizational units are identified in the organizational structure by an 8-character key.

Features

Responsibilities are evaluated by worklist processing at the time the function is called up. When processing clarification worklists, the accounting clerk receives those clarification items for which he or she is responsible, in other words that quantity of items that lies within the intervals to which he or she was assigned.

A responsibility consists of one or more intervals, such as the amount between 0 and 1,000 EUR. Within a role, you can assign organizational units to responsibilities. You can assign an unlimited number of responsibilities to a role.

Creating Responsibilities

To create a responsibility, proceed as follows:

1. From the **Create Standard Role** screen, choose **Goto** > **Responsibilities.**
2. Choose the **Create** function.
3. Enter the object key (used when using the F4 search function), the name of the object, and the validity period. Choose **Enter.**
4. The system now displays a screen on which you can enter the intervals for all the attributes defined in the container definition. Enter values in the intervals and save your entries.

You must now assign responsibilities to the organizational units. To do so:

1. Select the overview screen for the responsibilities for a role.
2. Choose **Edit** > **Create clerk assignment** and assign organizational units. You will be asked for the type of organizational object.
3. Specify the desired type and choose **Enter.**
4. The system displays a screen on which you can enter the search term and object key of the organizational object.
5. Enter the appropriate term and choose **Enter.**
6. On the screen that is now displayed you can restrict the validity area and create the assignment.

Repayment Requests

Use

If you are unable to assign payments received because the payments were not intended for your company, you can initiate repayment within the payment lot, provided qualified bank data exists.

Features

You can designate payments for refunding in a payment lot. The payment program then repays the amounts. A list display and a reversal transaction can be used for repayment requests.

Activities

To trigger a repayment, in the payment lot, select the field that allows you to pay out a refund.

Choose one of the following paths to display an overview:

- **Role** Incoming Payment Processing (SAP_FI_CA_INCOMMING_PAYMENTS) > Repayment Request Overview
- **SAP Easy Access screen** Payments > Clarification Processing > Repayment Request Overview

Choose one of the following paths to use the reversal transaction:

- **Role** Incoming Payment Processing (SAP_FI_CA_INCOMMING_PAYMENTS) > Reverse Repayment Request
- **SAP Easy Access screen** Payments > Clarification Processing > Repayment Request Reversal

Before the payment program can make a repayment, you have to select the With Repayments field in the payment run parameters. Make sure that the payment method for the repayment was also specified for the payment run. Repayment requests where the payment method is missing in the list of payment method or in which the bank selection has not been maintained in the bank details are recorded as exceptions with a separate item indicator.

Usage of Payment Advice Notes

Use

You use payment advice notes to enter details about anticipated payments. The key generated when an advice note is created can be used as a criterion to select open items.

Integration

When entering a payment lot, you can enter a payment advice note number as a selection criterion in addition to business partner or contract account. Open items belonging to the business partner named in the advice note are selected when a payment is posted. Using the specifications in the advice note items, clearing amounts are assigned to the items selected. Difference amounts that arise when the amount of the advice item cannot be completely allocated (in other words, when the amount of the open items is smaller) are grouped into a posting on account.

Features

A payment advice note is assigned to just one business partner. You may also assign a contract account.

In the advice note items, you enter one payment amount and one selection criterion. By specifying a selection criterion, you propose a use for the amount. Valid selection criteria include:

- Document number
- Reference number
- Contract number
- Contract account

When a payment document is posted, the system automatically determines the open items from a business partner that match the selection criterion. The system assigns the amount specified to these items.

If the amount in the advice note does not match the total of the open items, an industry-specific or customer routine decides how the amount is split up.

If the amount in the advice note is too low (underpayment), you can choose partial clearing. In the case of overpayment, the difference can be posted on account.

ℹ Note

To use and edit payment advice notes, you need authorization object F_KK_AVIS. It allows you to grant authorizations for the following activities:

- Create (01)
- Change and use (02)
- Display (03)

Payment advice notes with reference to several business partners

Example

An authority, for example, a social welfare office, pays contributions for several persons. A total amount is transferred. Information about how the amount is to be split is provided in separate correspondence.

In **Contract Accounts Receivable and Payable** , you can only create payment advice notes with reference to one business partner. However, if you receive payments from a business partner with explicit details of how the amount paid is to be split over other partners/accounts/contracts, you have to create a payment advice note where the items refer to different business partners. To solve this problem:

1. Instead of creating a payment advice note, create a separate payment lot merely for the purposes of distributing the total amount.
2. Transfer the actual payment to a general ledger account.
3. Using the separate payment lot, post the total amount to the opposite side of this general ledger account and distribute it to the contract accounts required.

For detailed information about the procedure, see SAP note 506230.

Create Payment Advice

Use

You create a payment advice when a payment is announced with detailed information about the note to payee.

Procedure

To create a payment advice, do the following:

1. Choose one of the following paths:

2.
    - **Role**

      Incoming Payment Processing (SAP_FI_CA_INCOMMING_PAYMENTS > Process Payment Advice Notes

    - **SAP Easy Access screen**

      Payments > Process Payment Advice Notes

3. Allocate a key and choose **Create**.
4. Specify the business partner and currency.

   To speed up entry, you can specify a selection category for all items.

   If you set the **Can Be Overwritten** indicator, you can overwrite the selection category for individual items.

   Depending on the selection category you choose, you can now add the corresponding field values and payment advice amounts to the list.
5. Save your entries.
6. When you have entered all the required items, choose **Save and Close**.

Selecting Open Items by Payment Advice Note

Use

You use this functionality if you receive a payment in which the note to payee refers to a payment advice note.

Prerequisites

The payment advice note must exist in the system.

Procedure

When you enter a payment or check lot, you can enter the advice note number as a criterion for selecting open items. When creating a payment or check lot, specify **payment advice note** as the selection category under **Specifications for selecting and clearing open items** . (See Creating Payment Lots Manually)

Usage of Payment Forms

Use

Payment forms are created automatically as part of correspondence, as in dunning and invoice printing.

Integration

You can use payment forms as a criterion for selecting open items.

Features

You can display all open and cleared items in a payment form. To do this, choose the following path:

- **Roles**

Incoming Payment Processing > (SAP_FI_CA_INCOMMING_PAYMENTS) > Payment Form Items Overview

- **SAP Menu**

Payments > Clarification Activities > Payment Form Items

You can select several payment forms with the same reference number with this function.

Generating Check Deposit Lists

Prerequisites

You have entered and closed a check lot.

Procedure

Choose one of the following paths:

- **Role** Incoming payment processing(SAP_FI_CA_INCOMMING_PAYMENTS) > Create check deposit list
- **SAP Menu** Periodic Processing > Data for Externals > Banks > Check Deposit List

On the screen that is now displayed, you choose the check lots for which checks are to be deposited. Using the form ID, you determine the format of the deposit list.

Correcting check numbers in check lot items

When, during the creation of a check deposit list, you establish that check numbers have been entered incorrectly for individual payments, you can correct these check numbers as follows (even in lots that have already been closed and posted):

1. In the SAP menu, choose Payments > Check Lot, and enter the required lot.
2. On the initial screen of the check lot, choose Edit > Correct Check Numbers.
3. Then call up the detailed display for the check payment to be corrected and select Edit > Correct Check Numbers. This makes the check number field ready for input.
4. Overwrite and save the check number.

To change the check number, you require authorization 014 for the authorization object F_KK_SOND.

Result

The system outputs a printed check deposit list that you can present to your bank together with the relevant checks. For more information, see the program documentation.

Cash Desk

Use

With this component, you can post and assign payments made and received at a cash desk manually.

Prerequisites

In order to process payments using the Cash Desk function, you have to make the following system settings in Customizing for Contract Accounts Receivable and Payable :

- Business Transactions > Payments > Processing Incoming and Outgoing Payments > Cash Desk/Cash Journal > Maintain Specifications for Cash Desk/Cash Journal
- You define the different document types to be used for posting the different payment categories for each company code and payment category in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > Cash Desk/Cash Journal > Define Document Type for Payment Category . Since four payment categories are supported – cash payment, check payment, payment card, and postal order – this means that you can define a maximum of four document types per company code.
- If you want to write off small differences, you have to activate the cash journal and define the corresponding expense and revenue accounts for the bank clearing account: Basic Functions > Postings and Documents > Document > Define Account Assignment for Automatic Postings > Automatic G/L Account Determination > Define Accounts for Expense/Revenue from Cash Desk Differences .
- If you want to process payments in your local currency and foreign currencies in the Cash Desk , you have to define the foreign currencies accepted in a company code as alternative payment currencies in Customizing (Business Transactions > Define Alternative Currencies) .

Using a short account assignment, you can perform G/L account postings for incoming and outgoing payments in the cash desk. You can perform the G/L account posting either with or without tax on sales and purchases. To do this, define the required short account assignments in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > Define Short Account Assignments for Transfers .

If you want to use bar code scanners, you have to:

- Set the indicator Display Input Field for Bar code in the Customizing activity Maintain Specifications for the Cash Desk/Cash Journal .
- Interpret the bar code scanned in event 6060.

  See the documentation of the sample function module FKK_SAMPLE_6060.

Since the Cash Desk has been integrated into the Cash Journal , you cannot call it directly when the Cash Journal is active.

Features

The header area contains the static data of a payment, such as the payment date and the company code. You can display or hide this screen area using a pushbutton.

In the central area of the screen, on the tab pages Simple Selection and G/L Account Posting , you can enter the selection criteria for payment and the data for the G/L account posting. Both tab pages support multiple entries.

The lower screen area contains a separate tab page for entering payment data for each of the payment categories supported:

- Cash payment
- Card payment

- Check payment
- Postal order

With the exception of cash payments, multiple entries are possible. This means that you can process a payment with one or more payment categories.

Example

1. case: Customer pays a receivable for 100 EUR with a cash payment of 100 EUR.

2. case: Customer pays a receivable for 120 EUR with a cash payment of 40 EUR and a check for 80 EUR.

The system displays the payment categories and amounts entered in a totals table. The system saves each payment posted automatically in a corresponding card lot, incoming check lot, outgoing check lot, postal order lot, or payment lot dependent on the payment category. The system thereby stores the payments in different lots dependent on the payment category (cash, card, postal order, or incoming and outgoing checks), the cash desk clearing account, company code, and card organization. The payment lots used in the Cash Desk function only include cash desk postings. You can only post and close payment lots in the cash desk. With the exception of check lots, you can deactivate the use of payment lots in the system settings.

In the cash desk, in addition to payments in your local currency, you can also process payments in foreign currencies, whereby you can also issue and clear the change in the local currency. The cash desk calculates the change automatically.

You can assign the payment to open receivables from a business partner automatically or carry out the clearing as part of manual account maintenance.See also the explanations for assigning open items automatically .

Activities

To perform a G/L account posting, in the header data enter a company code and a currency. You can also have the system propose these values as a default. To do so, enter the currency and company code, and from the menu choose Extras Note Settings .

Then, on the tab page G/L Account Posting , enter at least the following information:

- The required short account assignment that the system uses to perform the G/L account posting to a relevant G/L account
- An explanatory text
- An assignment number
- The tax code, if tax on sales and purchases is to be transferred too

You can print a receipt for each payment. If you set the indicator Print Automatically or Confirm Print in Customizing in the Specifications for the Cash Desk/Cash Journal , you can also create an entry in the correspondence container for cash desk receipts. The following events are processed:

- 6040: Entry in correspondence container
- 6041: Creation of receipt
- 6042: Printing of receipt

If you printed a receipt when you received the payment, you can carry out a repeat print.

Example

If a customer makes an incoming payment, and the indicator Confirm Print is set in Customizing, when you choose the pushbutton Receipt , a dialog box appears; here you can enter the specifications for the output parameters and the storage

mode. Then you can place the receipt in the print set for mass printing or print it immediately.

To trigger a repeat print for a receipt, call receipt printing, and in the dialog box that appears, enter the parameters for printing and storing the receipt and the document number of the payment document for which the receipt is to be printed. When you then confirm your entries, a replacement receipt is printed.

If you have activated the processing of bar codes in Customizing, in the Cash Desk menu under Extras > Barcode Entry > Display/Hide, you can hide or display the bar code entry field dependent on the workplace (depending on whether the workplace has a bar code scanner). In the menu under Extras > Note Settings, you can save the settings as user-specific.

Posting Payments in the Cash Desk

Use

You want to post an incoming or outgoing payment at a cash desk.

Procedure

1. Choose one of the following paths:
   - **Role** Cash Desk(SAP_FI_CA_PAYMENTS_AT_CASHDESK) > Cash Desk
   - **SAP Menu** Payments > Cash Desk > Cash Desk
2. In the header data area, specify the currency to be used for the payment.
3. Switch to the tab page for the payment category for which you want to enter a payment. Specify the amount to be paid and the amount received and specify whether this is an incoming or outgoing payment.
4. On the tab page Simple Selection , specify the selection criteria for clearing the open item, such as business partner, contract account, or document. You can display the business partner open items from the menu via Environment > Open Items. If you set the indicator Post on Account , the selection categories specified are used to post a payment on account as well as for selecting open items.
5. Choose the pushbutton Post or Post in Dialog in the application toolbar.

   If you select Post Item Online , the manual account maintenance appears and there you can assign the payment to the open receivables manually (see Assigning Clearing Amounts and Cash Discount).

Result

The payment was assigned and posted. Under Summary on the tab page for entering the different payment categories, the system displays the change to be paid to the customer (if applicable).

Other Functions

You can print a receipt for each payment if required. Choose the pushbutton Receipt in the application toolbar. In the Implementation Guide for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Processing > Cash Desk/Cash Journal > Maintain Specifications for Cash Desk/Cash Journal, by setting the relevant indicator, you can define that the system automatically prints receipts or prints them after confirmation.

On the tab page Simple Selection , you can use the pushbutton with the quick info text Delete to delete all parameters specified.

By clicking the pushbutton **Lot Management** in the application toolbar, you can display a dialog box with an overview of all open lots.There are also buttons for closing individual lots or creating new ones.

Payment by Payment Slip

Use

You can post incoming and outgoing payments in the cash desk directly, or you can use a two-step procedure based on payment slips (represented by payment forms). When this two-step procedure is used, the clerk first determines which items the customer has to pay or which items are to be paid to the customer. The clerk then creates a payment form for these items. The customer then takes the payment form to the person at the cash desk, who processes the payment and posts the incoming or outgoing payment in the cash desk.

Prerequisites

In Customizing for Contract Accounts Receivable and Payable, under:

- **Business Transactions** > **Payments** > **Processing Incoming and Outgoing Payments** > **Cash Desk/Cash Journal** > **Define Codes of Issuer**, you entered codes for your employees who issue payment forms.
- **Basic Functions** > **Open Item Management** > **Specify Selection Categories**, you defined payment advice as a selection category.

Features

As a first step, you identify the items to be paid by the customer or to be paid out by your company and summarize them in a payment form (payment slip). In the second step, you process the items listed on the payment form at the cash desk. You choose the selection category **Payment Advice** for the posting.

Activities

1. On the SAP Easy Access screen, choose **Payments** > **Create Payment Form for Cash Desk**.
2. In the **Selection details** group box, enter the parameters you want to use to select the incoming or outgoing items. Enter the following in the **Payment Parameters** group box:
    - Your issuer code
    - The date for the incoming or outgoing payment
    - The currency for the payment
    - Application form and output device for printing the payment form
3. From the application toolbar, choose the pushbutton **Payment slip**.
4. On the next screen, select and activate ( ) those items that you want to place in the payment instruction. (For more information, see Assigning Clearing Amounts and Cash Discounts.)
5. Choose and print the payment form. If you enter both the **Application Form** and the **Output Device**, printing takes place automatically. If you make an entry in only one of these two fields, the system displays a dialog box. There you you can specify if you want to print or not.

   The system creates the payment form as a payment advice.

For outgoing payments, you are required to print the payment form. In the case of a procedure requiring written approval, you can then use the printed form to obtain a manager's signature before the customer receives the payment at the cash desk.

For incoming payments, the system does not require that the payment form be printed. The customer can present the printed form at the cash desk, or simply provide the payment advice number. If the customer just provides the payment advice number, then the person operating the cash desk can display the payment advice by choosing, on the SAP Easy Access screen, Payments > Process Payment Advice Notes > From Customer.

Reversing Payment Documents

Use

You can reverse payment documents in the cash desk.

Prerequisites

To assign a role the authorization for reversing, set the Maintain Role-Specific Activities for Cash Journal indicator in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > Cash Desk/Cash Journal > Maintain Role-Specific Activities for Cash Journal. SAP delivers this setting for the roles of branch manager and cashier with special tasks.

Features

You can select payment documents for reversal by using the date or the payment document number.

Before you reverse a document, you can double click on it to go to the detail display of the payment document.

You can reverse multiple payment documents together in one step.

You can reverse payment documents in payment lots that are already closed. For example, if you discover later on that a check is not covered, this allows you to reverse the check payments.

You can also reverse mixed payments, that is, payments that consist of more than one payment category.

Note

Example: A customer pays a receivable of 100 with 50 in cash and 50 as a check, but the check is not covered. You can then reverse the partial amount of 50 with the payment category check. Or you can reverse the entire payment of 100.

You can display reversed payments in the historical data of the cash journal. This enables you to get a better overview of the activities of the cash desks in a branch.

If you reverse payments in payment lots that are already closed, the system displays the reversal in the cash balance. The system does not display reversals that relate to payment lots that are still open.

The reversal function is also integrated in the cash journal.

Activities

1. In the menu of the cash desk, choose Environment > Reverse Payment.

2. Enter the number of the payment document you want to reverse, or limit your selection by entering any date, today's date, or an entry period.

3. For posting the reversal, enter the reconciliation key to be used, the clearing reason, and the reversal date.

4. Choose **Continue**.

5. In the **Clearing Documents** area, the system displays the documents that meet your selection criteria.

   The symbols in the **Clearing Status** column indicate if you can reverse the payment document:

   - indicates that you can reverse the document.
   - indicates that you cannot reverse the document.

     In that case, you also cannot select the document. The exception is if the system also displays the symbol in the **Payment Document Category** column. This symbol indicates that there is a mixed payment that was already partially reversed, but that it still contains items that can be reversed.

     Example

     There is a mixed payment that was made partly in cash and partly by check. The check payment was already reversed.

6. Select the documents you want to reverse. You can select multiple documents.

   The system transfers the selected documents to the **Selected Documents** area. If you select a mixed payment, the system generates a row in the table for each payment category. By double clicking on the pushbutton in the **Clearing Document Category** column, you can remove partial payments of mixed payments that you do not want to reverse.

7. Choose **Post (Reverse Payment Documents)**.

The system reverses all documents displayed in the **Selected Documents** screen area.

To display reversals in the history of the cash journal, choose **Environment** > **Historical Data** in the menu of the cash journal. Navigate from the branch to the cash desk, and expand the **Payments** file.

The Cash Journal

Use

You can define the cash desk structure for your company in the cash journal. This means that the cash journal maps the cash desk structure of your company. The cash desk structure includes the cash desks that your company has in individual branches. The branches and their cash desks form the master data for the cash desk structure and are a prerequisite for the cash journal.

Integration

The cash desk has been integrated into the cash journal. This means that all incoming and outgoing payments are posted with the cash desk. You can navigate to the cash desk from the cash journal and vice versa. The cash desk assigned to a clerk and further assignments made by the system (or by you) are forwarded to the cash desk. If you use the transaction **Cash Journal** , you cannot call up the transaction **Cash Desk** directly.

Prerequisites

If you want to use the cash journal in your company, you have to carry out the following activities in the Customizing for **Contract Accounts Receivable and Payable** under **Business Transactions** > **Payments** > **Processing Incoming and Outgoing Payments** > **Cash Desk/Cash Journal** :

- Prevent direct access to the cash desk by setting the indicator **Activate Cash Journal** in the activity **Maintain Specifications for the Cash Desk/Cash Journal**
- Make the basic settings and create the master data in the activities **Maintain Specifications for the Cash Desk/Cash Journal** and **Define Master Data for the Cash Journal**

If you want to carry out cash desk closing, you have to activate this function in the activity **Maintain Specifications for Cash Desk/Cash Journal** . When you maintain the activity **Cash Journal:Specifications for Posting Cash Deposits and Withdrawals** , make sure that you maintain different cash desk clearing accounts for deposits and withdrawals. However, you can use the same G/L account for deposits and withdrawals.

You can control the authorizations for postings and evaluations at the cash desks using user roles.To do this, you have to activate the role concept and assign roles to the individual users (cashiers) (see Maintaining Responsibilities for Users).

You control the authorizations for the cash journal with the authorization object F_FKKCJ.

ℹ Note

Previous to Release 4.72, the authorizations in the cash journal were protected by the authorization object F_FBCJ. If you cannot change over to the authorization object F_FKKCJ in the cash journal quickly after an upgrade, see SAP Note 667984. Note that you should deactivate the temporary solution described there as quickly as possible. After Release 4.72, SAP only supports the authorization object F_FKKCJ.

Features

Using the cash desk structure, the system updates the transaction data that arises from posting with the cash desks. The cash desk structure also evaluates the postings to the cash desks and provides special postings, such as deposits, withdrawals, differences, and their reversals, and the evaluation of cash desk closing.

Master Data

You can define several branches in the cash desk structure. You can then assign multiple cash desks to these branches. You can add branches and cash desks to the cash desk structure at any time.

Transaction Data

The transaction data includes the information that arises from postings to the cash desks, from opening balances when opening cash desks, or from closing balances when closing cash desks. These are postings of the categories **Withdrawals, Deposits,Reversal of Special Postings** , and **PostDifferences** . You can use the following functions:

- Open cash desks

  A user with the appropriate authorization (administrator) can automatically open all cash desks in all branches using report RFKK_CASHDESK_OPEN_AND_CLOSE(batch input session) before the start of business. Alternatively, each authorized user in the cash journal can open all the cash desks in his or her branch explicitly using the function **Open Branch Cash Desks** in the **Cash Journal** menu under **Special Functions** . For each posting, the system determines the lot to be used automatically (for example, payment or check lot), or, if necessary, creates a new lot. The system uses the branch ID and the number of the cash desk for which the lot is being created for the first (maximum) five characters of the number for the new lot. If the responsibility for postings is transferred, the system automatically closes all existing lots for the previous user. In the cash desk, lots created in the cash journal are displayed in the field **Lot** ; however, you cannot change these.

Incoming and outgoing check payments are managed in separate check lots to simplify reconciliation.

- If a user is using the cash journal for the first time, he has to assign himself to a cash desk. This assignment is stored in the user master data and is used automatically the next time the user calls up the cash journal. If a user is assigned to several cash desks, he or she can select another cash desk (menu: Cash Desk > Other Cash Desk).
- The opening balance is the last closing balance provided the cash desks were not completely emptied before the last closing.
- Post deposits to a cash desk
- Post withdrawals from a cash desk
- Reverse withdrawals, deposits, and differences (special postings)
- Reversal of payment documents
- Post cash desk differences
- Close cash desks

  Users can close either only their own cash desk or all cash desks in the branch, depending on what authorization they have (see above). You can close the cash desks in a branch, for example, in a batch job after the close of daily business or from the cash journal for all cash desks in the branch, using report RFKK_CASHDESK_OPEN_AND_CLOSE.The lots that are still open are closed automatically, so that no further postings can be performed. Note that before you close the cash desks, you have to reconcile the cash balance with the general ledger.
- Determine the current cash desk balance (cash balances per currency)
- Transfer responsibility for documents and payment lots from another clerk to yourself
- A user can evaluate the transaction data of a cash journal historically or for the current day depending on the role assigned to him. A user with the role Cashier can only evaluate the data of his or her own cash desk. If the cash journal is not active (Customizing), you cannot evaluate postings to the cash desks in the cash journal. Also if you subsequently activate the cash journal, you cannot evaluate postings that you carried out before this activation in the cash journal. You should therefore avoid changing the settings (Cash Journal Active/Not Active) during business.
- Cash desk closing

You can archive the transaction data of the cash journal. If documents have been archived, these are included in the historical evaluations.

Maintaining Responsibilities for Users

Use

You want to control the authorizations for postings and evaluations in the cash journal via user roles.

Features

By assigning different user roles, you can give your employees in a branch different authorizations.

If you do not use the role concept in the cash journal, each user automatically has the same authorizations as the role of the branch supervisor. You do not have to assign this role to a user explicitly.

Activities

To use user roles in the cash journal, you first have to activate the role concept. To do this, in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Processing** > **Cash Desk/Cash Journal** , in the activity **Maintain Specifications for Cash Desk/Cash Journal** , set the indicator **Use Roles** in the area **Cash Journal Settings** .

In the activity **Maintain Role-Specific Activities for the Cash Journal** , you can define the activities permitted for the individual roles. Alternative, you can use the button **Accept Standard** to use the standard setting delivered by SAP for your application area. You can adjust these standard settings to your requirements at any time.

Then, in the SAP menu, choose **Payments** > **Cash Journal** > **Responsibilities** and assign one of the following roles to the individual users (cashiers):

- Branch supervisor (Role 21000058)
- Cashier with special tasks (role 21000059)
- Cashier (Role 21000060)

Note

You should only assign one branch to each branch supervisor.

A cashier can assign a cash desk in the branch for which he has this authorization to himself, provided this cash desk has not already been assigned to another cashier. You can assign the role of cashier for a cash desk in a branch several times. In order for the system to assign the cash desk uniquely, you have to enter it in the user parameters of the cashier.

Note

In event 6120 you can assign the cashiers to the cash desks uniquely. To do this, define an installation-specific function module in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Program Enhancements** > **Define Customer-Specific Function Modules** .

Posting in the Cash Journal

Use

You can use the cash journal to log and evaluate postings to the cash desks for your company. All postings take place per cash desk and branch office.

Prerequisites

If you want to carry out cash desk closing, set the indicator **ActivateCash Desk Closing** in the activity **Maintain Specifications for Cash Desk/Cash Journal** in the area **Cash Journal Settings** . If you want to display the cash desk balance cumulated and independent of the process category, set the indicator **Display Cumulated** . If you want to use the currency sheet to enter the actual balances for cash desk closing, define the currency units in the activity **Cash Journal:Define Currency Units of Currency Sheet** .

Procedure

Choose one of the following paths:

Role **Cash Desk** (SAP_FI_CA_PAYMENTS_AT_CASHDESK) → **Cash Journal**

SAP Easy Access screen Payments → Cash Desk → Cash Journal

Choose the branch and the relevant cash desk. If you are accessing the cash journal for the first time, a dialog box appears where you have to assign yourself to a branch and a cash desk. You can change the cash desk from the menu by choosingCash Desk → Other Cash Desk. If you use the role concept, you can integrate this selection by assigning a cash desk to each user in the user master record for parameter 8BC. You can then use the following functions:

Function	Procedure
Cash balance	The cash balance (Environment → Cash Balance) gives an overview of the balances for the cash desk(s) a user is assigned to in the cash desk structure. The system determines the cash balance from all open and closed lots for which no complete withdrawals have been posted. It determines the cash balance per currency and, depending on the system settings, per process and payment category. You can double-click to display details such as the individual payments and deposits.
Post deposits	Choose Cash Desk → Post Deposit. Specify the company code and the deposit amount in the Amount field. Choose the Post pushbutton. A posting Bank Clearing Account (Cash Desk) to G/L Account is executed.
Post differences	SAP recommends posting differences before the cash desk closing. Post the differences per currency and branch cash desk posted. In the standard system, the posting of differences is only supported for cash payments. If you also want to post cash desk differences for other payment categories, you have to set the indicator Enable Posting of Differences for All Payment Categories in the activity Maintain Specifications for Cash Desk/Cash Journal in Customizing for Contract Accounts Receivable and Payable under Business Transactions → Payments → Processing Incoming/Outgoing Payments → Cash Desk/Cash Journal. In the menu choose Edit → Differences . The subsequent dialog box shows the overview for each payment category, provided you can post differences for all payment categories. In the column Balance , the system shows the cash balance determined from the lots (actual balance). If necessary, change the date of the difference posting in the header data. As standard, the system displays the current date. You can change these specifications to meet your requirements using an installation-specific function module for event 6120. Select the required balance(s) and choose the pushbutton (Activate). Enter the amount you determined in the Actual Balance field. Choose Post . For each activated item, the system posts one document for differences. When you post the differences, the posting is Expense Account to Bank Clearing Account , or, in case of an excess, Bank Clearing Account to Revenue Account.

Function	Procedure
Post withdrawals	If you want to withdraw an amount from a cash desk, choose Cash Desk → Post Withdrawal . In the header data you can change the date of the withdrawal if necessary. As standard the current date is displayed. You can change these specifications to meet your requirements using an installation-specific function module for event 6120. The overview shows the actual balance per payment category. Select the balance(s) from which you wish to withdraw the amount and activate it. Post the withdrawal. For each activated item, the system posts one withdrawal document and, if necessary, a deposit. This posting category is Withdrawal Account to Bank Clearing Account (Cash Desk). You can also post a partial withdrawal for cash balances. However, in the case of a partial withdrawal, you can only post the remaining amount as a new deposit. This does not change the cash balance. This improves performance for the determination of the current cash balance. SAP recommends that you post the remaining amount of the cash withdrawal as a new deposit (for example, change that stays in the cash desk permanently) at regular intervals, or, for example, before or after closing at the end of the day. The lots are closed whether you withdraw the whole amount or only part of the amount. If you withdraw the full amount of a balance (deposit, difference, reversal of withdrawal), this balance is no longer included in the overview if you choose the Post Withdrawal function again. If you have only posted a partial withdrawal, this balance is then available with the remaining amount for further withdrawals.
Reverse withdrawal	To reverse a posted withdrawal, in the menu choose Edit → Reverse Withdrawal . Proceed as follows: Select the payment type for which you want to reverse the withdrawal. Confirm or change the date of the withdrawal. As standard, the system sets the current date. You can change these specifications to meet your requirements using an installation-specific function module for event 6120. All withdrawals not reversed yet are displayed in the overview. Select the withdrawal documents that you want to reverse and activate these documents. Post the reversal. This posting category is Bank Clearing Account (Cash Desk) to Withdrawal Account. The document selected is reversed and the cash balance is corrected.
Transfer	If you want to use the role concept and, for example, only some of the employees in your company have the authorization for G/L-relevant postings, you can use the function Transfer (Edit →

Function	Procedure
	Transfer) to transfer the responsibility for payment lots to a user with the appropriate authorizations. To ensure data consistency, the system closes all open lots during the transfer.
Create lot Close lot	Regardless of whether you are carrying out cash desk closing, posting withdrawals, or transferring lots, you can close any types of lots to prevent additional postings in these lots (for example, at the end of a working day, changing of clerk, or if you want to create a check deposit list). To do this, choose Cash Desk → Close Lot . In a cash desk, you can also use the pushbuttonLot Managementto close lots or to create new ones. The cash journal checks whether there is already a lot for payments with the same payment category. If this is the case, no new lot is created. This means that before you can create the new lot, you have to close the existing lot. Only create the payment lot manually in exceptions, for example, if you want to document certain incoming payments separately in a lot created for this purpose. As standard, the system creates all payment lots required automatically. You can influence the assignment of the lot ID at event 6170.
Cash desk closing	During cash desk closing (menu: Special Functions → Cash Desk Closing → Carry Out Cash Desk Closing), the system compares the actual balances with the target balances of the cash journal cash desks and displays any differences that occur. You can use a currency unit sheet to enter cash desk actual balances. Here you enter the coins and notes per currency. After you have saved, you can print the cash desk closing and also reprint it at a later time. Regardless of whether you are carrying out cash desk closing for one cash desk, you can still open and close cash desks. Cash desk closing is not a prerequisite for opening and closing cash desks. However, if you are carrying out cash desk closing, the cash desk concerned is automatically closed. If you want to carry out further postings to this cash desk, you have to reopen it.
Overview of cash desk closing	In the overview of the cash desk closing (menu: Special Functions → Cash Desk Closing → Display Cash Desk Closing), you can display the cash desk closing carried out for the current cash desks and branches configured in the cash journal dependent on the following selection criteria: Cash desk Branch Date of cash desk closing Closing created by Status of closing Although you can only display the cash desk closing for the cash desks and branches currently assigned to you in the cash journal, on the SAP Easy Access screen under Payments → Cash Desk → Overview of Cash Desk Closing , you can use report RFKK_SHOWCHDSKCL to display an overview for all cash desks and branches. Make sure you read the report documentation. If no

Function	Procedure
	roles are active in the cash desk, all cash desk closings that meet the selection criteria are displayed.
Evaluation of historical data	You can evaluate the data in the cash journal either using the menu of the cash journal under **Environment → Historical Data** , or using a separate transaction from the SAP Easy Access screen under **Payments → Cash Journal → Cash Journal Evaluation.** When you call up the evaluation via the environment menu of the cash journal, the system checks the authorization using the role concept of the cash journal. In Customizing for **Contract Accounts Receivable and Payable** under **Business Transactions → Payments → Incoming/Outgoing Payment Processing → Cash Desk/Cash Journal → Maintain Role-Specific Activities for the Cash Journal** , you define the roles for which historical evaluations are to be permitted. If the role concept is not active, every user has access to the data for all cash desks of the branches currently active. If the role concept is active, the evaluation for each cashier is carried out only for the current cash desk selected. Cashiers with special tasks or branch supervisors can also carry out evaluations for other cash desks of the current active branch. To activate the access via the environment of the cash journal for a user, in the master record for this user, define the SET/GET parameter **8BJ** with the value **X** . If you select **Environment → Historical Data** in the cash journal, you can restrict the period for the evaluation in the header of the screen. If you do not enter a period here, all existing data is output. The system displays the totaled amounts per cash desk, payment type, or process type and currency. By navigating in the tree structure and double-clicking on individual nodes, you can display more detailed information about the payments and postings. By double-clicking on a document number or a payment lot on the right of the screen, you can display the document or payment lot. Using the corresponding pushbuttons, you can display or hide the selection data in the header area. If you call up the transaction from the SAP Easy Access screen under **Payments → Cash Journal → Cash Journal Evaluation** , you can carry out evaluations for any intervals of branches, cash desks, currencies, payment types, and process categories. To call up the evaluation directly via the transaction, you require authorization B5 for the authorization object F_FKKCJ. See the report documentation.
Reverse withdrawals, deposits, and differences	In the menu choose **Processing → Reversal of Special Posting Documents** . You can only reverse deposits or differences if they have not been partially or completely withdrawn.
Reversal of payment documents	In the menu choose **Processing → Reverse Payment** . For more information, see Reversing Payment Documents .

You can post deposits, differences, and withdrawals as line items. If the indicator **Line Item** is set, the general ledger items in the reconciliation key are not grouped and therefore, when you transfer the relevant reconciliation key from FI-CA to the general ledger (FI), line items are created.

Additional Functions in the Cash Journal

You can choose Goto **Cash Desk** to go directly to the cash desk

Incoming Payments from Payment Service Providers

Purpose

In some countries, customers of telecommunications and utility companies can pay their bills with a payment form at payment service providers as well as to the company concerned. The payment service providers are called external payment collectors below, and include post offices, banks, or chain stores (convenience stores/CVS). After receiving the payment, the external payment collector settles with the company to whom the liability was due.

Prerequisites

Activate the processing of incoming payments by third parties by setting the indicator **Payment via External Payment Collectors** in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Basic Functions** > **Postings and Documents** > **Basic Settings** > **Maintain Central Posting Settings** .

You make the system settings for processing payments collected by external payment collectors in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Processing** > **External Payment Collectors** .

Procedure

Once an external payment collector has received payments from customers, it first sends a file with advance information to the company to whom the payment belongs, and then a confirmation file. The following business processes then take place in the company:

1. Transfer of advance information with the payments collected

   The payment data is transferred using payment lots. The open receivables are cleared using the payment form number provided to the customer on the invoice and contained in the file for the payment. It is used for payment assignment.

   The receipt of the payments contained in this file is not guaranteed. When the data is transferred, the payments reported receive the status **Unconfirmed** .

   Dunning and interest calculations for open items are based on the date of the advance payment information.

2. Transfer of the confirmations of the payments contained in the advance informationThe payment data is transferred from the confirmation file with the program RFKK_CVSPAY_CONFIRM (SAP menu: **Payments** > **External Payment Collectors** > **Transfer Payment Confirmations**). After the transfer, the receipt of the payments is guaranteed and the payments receive the status **Confirmed** in the system. The program creates exceptions for payments that fulfill the following criteria, and you can process these exceptions later in a clarification list :

   - There is no advance information for the payment.
   - The payment has already been confirmed.
   - The payment has already been recalled.
   - The payment amount is not correct.

     In the file with the confirmations, a payment collector can also provide information about payments notified that have been called back or correct payment information. In these cases, the advance notification is reversed. The company does not receive a payment. Payments called back are processed in returns lots.

3. Clarification of exceptions created during the transfer of confirmations (SAP menu: Payments > External Payment Collectors > Clarification of Payments Transferred).

4. Calculation of stamp tax and commission

   At the end of the month, the external payment collector bills the company for the stamp tax and commission. Using program RFKK_CVSPAY_EXAM, you can compare the receivables contained in these invoices with the payments posted and confirmed in the system.

In the account balance display, the items reported and confirmed by external payment collectors have the icon with the quick info Payment Notified by External Payment Collector .

Post offices and banks only transfer one file with confirmed payments. The payments are posted with payment lots. Since the payments have already been confirmed, the stamp tax due is calculated automatically. This means that you do not have to transfer the payment data separately with program RFKK_CVSPAY_CONFIRM. The stamp tax and commission are also billed separately. Again, you can use program RFKK_CVSPAY_EXAM to compare the data.

Make sure you read the report documentation.

In the following events you can influence the processing of payments from external payment collectors:

- 0020: FKK_EVENT_0020_CVS (industry-specific)
- 1500: FKK_SAMPLE_1500
- 0110: FKK_CLEARING_PRPOSAL_0110_CVS (customer-specific)
- 0242: FKK_EVENT_0242_CVS (industry-specific)

Define the required installation-specific function modules in the Implementation Guide for Contract Accounts Receivable and Payable under Program Enhancements > Define Customer-Specific Function Modules .

Transferring the Advance Information

Use

You want to enter the payments reported by external payment collectors as advance information in the system.

Prerequisites

In the Implementation Guide for Contract Accounts Receivable and Payable , under Business Transactions > Payments > Incoming/Outgoing Payment Processing > External Payment Collectors > Define External Payment Collectors and Define External Payment Collector Code for Payment Lots, you have made the required settings .

Features

The payment data reported by post offices, chain stores, and banks in the advance information is processed in payment lots.

Activities

1. From the SAP menu, choose Payments > Payment Lot.

2. In the payment lot header enter the following data:

- Payment collector code
- Payment status **Unconfirmed**
- Clearing reason 26

3. You must also specify the bank clearing account (interim account) defined in Customizing.
4. Choose the payment form number as selection criterion and enter only the payment form number as selection criterion in the items.

See also the documentation for **Functions for Payment Lots** .

Transferring Confirmation Files

Use

In the second step you want to process the payment data confirmed by external payment collectors in the system.

Prerequisites

In the Implementation Guide for **Contract Accounts Receivable and Payable** , under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Processing** > **External Payment Collectors** > **Account Determination for Payment Confirmation** , you have defined an account for the interim posting.

Features

You transfer the payments confirmed by an external payment collector using the program RFKK_CVSPAY_CONFIRM (SAP menu: **Payments** > **External Payment Collectors** > **Transfer Payment Confirmations**). The structure of the payment data transferred in the files must correspond to the structure defined by the program. This enables you to group payment data reported by different payment collectors in different files and process them together in one activity. The program

- Carries out a transfer posting for all valid payment entries in the file from the interim account to the bank clearing account
- Calculates the stamp tax due to the external payment collector for collecting the payments
- Updates the entries for the confirmed payments

  It sets the status of the payments to **Confirmed** and saves the date of the payment confirmation, the amount of the stamp tax, and the transfer posting document created during the transfer from the interim account to the bank clearing account.

Calling Back, Reversing, and Correcting Payments

Use

Callback and correction of payments that you process via external payment collectors.

Features

Calling Back Payments

You can process the callback of payments that an external payment collector transmits in the prenotification in returns lots (SAP menu: **Payments** → **Returns** → **Returns Lots**). The processing takes place via returns category 05. Make sure that you use the payment form number as selection criterion. When you post the returns lot, the system sets the status **Called Back** for the corresponding payment. To determine the payments that cannot be called back, you can use event 0061 (customer-specific).

Correcting Payments

You can also process payment corrections that external payment collectors inform you of by file after the callback in **Contract Accounts Receivable and Payable** . The processing involves two steps:

In the first step, you have to summarize all corrections reported by external payment collectors in a file and post them in a payment lot as described above. Set the status of the reported payments to **Corrected** . When you post the payment lot, the status **Corrected** is set for the corrected payment.

Transfer the payment data from the confirmation file with program RFKK_CVSPAY_CONFIRM.

If you want to exclude certain payments from a correction, you have to implement corresponding criteria in event 0240. As an example, you can use function module FKK_EVENT_0240_CVS (customer-specific). If the payment for a payment form was posted as a payment on account, and a callback has taken place, in event 0255 you can determine the payment on account for this payment form. As an example, you can use function module FKK_EVENT_0255_CVS.

Reversing Payments Reported by External Payment Collectors

SAP provides sample function module FKK_EVENT_0070_CVS (customer-specific) for reversing payments.

Monitoring Incoming Payments

Use

To monitor the payments reported and confirmed by external payment collectors and the stamp tax and commission billed by the external payment collectors, you can use report RFKK_CVSPAY_EXAM.

Features

You can use report RFKK_CVSPAY_EXAM to

- Monitor the incoming payments reported by external payment collectors
- Check invoices received from external payment collectors for stamp tax and commission
- Check unconfirmed payments after a specific period has expired

You can use sample function module FKK_SAMPLE_1510 in event 1510 to settle the commission and stamp tax due.

Activities

In the SAP menu choose **Payments** > **External Payment Collectors** > **Monitor Payments** .

Clarifying Confirmed Payments

Use

During the transfer of the confirmation file, the transfer program RFKK_CVSPAY_CONFIRM creates exceptions for inconsistent payment data and places these in a clarification list.

Procedure

1. To process the clarification cases created, in the SAP menu choose Payments > External Payment Collectors > Clarification of Payments Transferred .
2. Enter the parameters according to which you want to select clarification cases for processing, and then choose Execute .

Note that the system filters the clarification cases based on the status during the selection depending on the user mode (for example, administrator). This means that cases that have already been clarified or that are locked by other users are not displayed in all modes.

The clarification cases selected are output in an ALV list that you can process with the standard functions of the ALV Grid Control .

- To display details for a clarification case, select the case in the list and in the menu, choose Edit > Detail Info or double-click on the case. The detail view shows the details from the confirmation file that have led to the creation of the clarification case. The data confirmed by the external payment collector appears in the area Confirmation Data , and the data from the advance information (real time file) that is to be confirmed appears in the area Unconfirmed Payment Form Data .
- To set a payment in the clarification list as confirmed, select the case required in the list and then choose Set to Completed in the application toolbar.

This function is only available in administrator mode. When you set a payment to completed, you can no longer change it.

- To process a clarification case, select the case in the list and in the menu, choose Edit > Clarify. On the following screen, you can use the functions specified in the table for processing. If there are several payments for the payment form number selected, these are offered in a list for selection. You can display a payment by double-clicking on it.

You want to	Procedure
Confirm a payment	1. Enter the correct data in the area Corrected Data . 2. Confirm the entry with the button Confirm Payment . The system carries out the following steps: 3. Sets the status of the data reported in advance to Confirmed (from 01 to 02) 4. Calculates the stamp tax due on the payment amount and, if necessary, sets the relevant indicator 5. Sets the date of confirmation (information from the confirmation file) 6. Assigns a document number for the payment document posted 7. Sets the clearing reason for the document cleared by the payment. 8. Posts the payment received

You want to	Procedure
Assign unconfirmed data to a payment form number	1. Choose the button Find Payment . 2. Enter your selection criteria and choose Continue . 3. Place the cursor on the payment required in the list and choose Transfer . 4. Save your entries.
Indicate a reported payment confirmation as Invalid	In the area Status/Lock Information , in the field Last Processing Status , select the value Invalid and save your entry.

Processing Payments at External Cash Desks

Use

You can use external cash desk services to transfer payments from your customers made at internal and external payment collectors (branches) to Contract Accounts Receivable and Payable (FI-CA).

Prerequisites

You defined your cash desk structure and the master data for external cash desk services (SAP Easy Access screen under Payments External Cash Desk Services). See also the documentation for the corresponding activities in Customizing for external cash desk services.

You made the required settings in Customizing for Contract Accounts Receivable and Payable under Business Transactions Payments Processing Incoming and Outgoing Payments External Cash Desk Services .

Features

There are four branch categories in FI-CA:

- Offline branch without agent (category A)
- Agent offline branch with agent posting (category B)
- Agent online branch with G/L account posting (category D)
- Online branch

In external cash desk services, you can process payments from branches of the categories 'offline branch without agent' (category A) and 'offline branch with agent' (category B and category D). For agents, there are two possible variants for posting closing. For an agent of category B, the cash desk closing is an agent posting (reconciliation in Contract Accounts Receivable and Payable). For an agent of category D, the cash desk closing is a G/L account posting (reconciliation in the general ledger).

The cash desks of an online branch represent the cash desks of the cash journal in FI-CA. Here you enter and post incoming and outgoing payments directly in the SAP system and not by using external cash desk services. For the cash desks of online branches, you can also evaluate payments directly in the system as part of the scope of functions of the cash journal and execute follow-up postings such as deposits, withdrawals, differences, and reversals to the cash desk balance.

In the case of the offline branch without agent (category A) or offline branch with agent (category B and category D), the cash desks where the payments are processed are not permanently connected to the SAP system. For both an offline branch without agent (category A) and an offline branch with agent (category B), FI-CA currently only receives XI messages that refer to incoming payments to external cash desks.

Offline branches without agent (category A) and offline branches with agent (category B and category D) are represented by their own master data objects (see Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Processing Incoming and Outgoing Payments** > **External Cash Desk Services** > **Define Master Data for External Cash Desk Services**). For an agent of category B, you have to create the agent as a business partner in FI-CA, and assign the cash desks to a contract account. For an agent of category D, for whom reconciliation takes place in the general ledger, you do not have to create the agent as a business partner in FI-CA, nor do you have to assign the cash desks to a contract account

ℹ Note

Data transfer for outgoing payments to external cash desks is not supported.

The external cash desk services consist of the following enterprise services, whereby the transfer of the data between the SAP system and the external cash desk system can be synchronous or asynchronous using the SAP Exchange Infrastructure (XI).

- `CashPointPaymentCreateNotification`

  The asynchronous service `CashPointPaymentCreateNotification` enables sending payment information of an external cash desk to FI-CA.

- `CashPointPaymentReverseNotification`

  Using the asynchronous service `CashPointPaymentReverseNotification`, you can reverse payments previously sent.

- `CashPointClosingDocumentNotification`

  For reconciliation purposes, FI-CA can be provided with information for cash-desk closing by the asynchronous service `CashPointClosingDocumentNotification`.

- `CashPointOpenItemSummaryByElementsQueryResponse`

  The cash desk uses the synchronous service `CashPointOpenItemSummaryByElementsQueryResponse` to query the open items of a business partner in FI-CA.

- `CashPointOpenItemSummaryNotification`

  Using a mass activity in FI-CA, you can send open items to cash desks asynchronously using the service `CashPointOpenItemSummaryNotification`.

From a technical point of view, all services are realized by means of XI service interfaces and are made available to the software component `FI-CA` by the XI content.

You can download the XI content using the SAP Service Marketplace for the application component of your industry solution.

Processing Incoming Payments

Use

Posting, reversing, and reconciliation of payments of offline branches

Integration

In the document display for a payment, the **External Cash Desk** tab page contains detailed information about the payment.

For documents posted using external cash desk services, in the account balance display, you can display detailed information about the payment by choosing **Environment** > **Payment Data** > **From External Cash Desk** .

Features

Using the **enterprise service** CashPointPaymentCreateNotification , you can forward payments made at cash desks of offline branches (with and without agents) to FI-CA.

Using the **enterprise service** CashPointPaymentReverseNotification , you can reverse payments made at cash desks of offline branches (with and without agents) in FI-CA.

In FI-CA, you reconcile the postings that were made at cash desks of offline branches with agents. For postings at cash desks of offline branches without agents, **no** reconciliation is possible in FI-CA.

Activities

To reconcile the SAP system (FI-CA) with the external cash desk system(s), create an agent posting - that is, a receivable due from the external cash desk system or the agent. You post these agent postings to a separate contract account that you define in the master data for the external cash desk services in Customizing.

In addition to the settings for processing payments from offline branches in Customizing for FI-CA under **Business Transactions** > **Payments** > **Processing Incoming/Outgoing Payments** > **External Cash Desk Services** , in the configuration of the **Integration Builder** , you must link the enterprise services **CashPointPaymentCreateNotification** and **CashPointPaymentReverseNotification** with the messages of the external cash desk using the **SOAP Adapter** or **File Adapter** , for example. For more information, see the documentation of **SAP NetWeaver** under **SAP NetWeaver Library** > **SAP NetWeaver by Key Capability** > **Process Integration by Key Capability** > **SAP NetWeaver Exchange Infrastructure.**

Transferring Payments

Use

Transfer of payment information from offline branches to **Contract Accounts Receivable and Payable**

Prerequisites

In order for the payments posted in FI-CA to automatically clear the related receivables, you have configured clearing control in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Basic Functions** > **Open Item Management** > **Clearing Control** .

Features

The **Enterprise Service CashPointPaymentCreateNotification** supports the transfer of individual and multiple payments in a message. Payment information sent to FI-CA via the **Enterprise Service** is made persistent in FI-CA and leads to the posting of the payment and the clearing of the related open item provided you have configured the clearing control accordingly in FI-CA.

If a payment cannot be posted directly, this payment receives the status **Posting not successful, repetition planned** .

You can read the status of a payment in the Monitor for External Cash Desk Services .

The system automatically creates a reconciliation key or reuses a relevant reconciliation key for the posting. The syntax of the reconciliation key corresponds to the form EXCYYMMTT, whereby EXC is a fixe prefix, YY signifies the current year, MM the current month, and DD the current day. The nnn places receive a sequential numbering from 001 to 999. If a reconciliation key cannot be reused on the same day, the system calls the reconciliation key with the next number.

Enterprise Service CashPointPaymentCreateNotification

Definition

Transfers payment information from an external cash desk to **Contract Accounts Receivable and Payable** .

Structure

Type Definition	Name
CashPointReferenceID	ID of the cash desk
CashPointOfficeReferenceID	ID of the branch
PaymentTransactionID	ID of payment
CashPointPaymentGroupReferenceID	ID of grouping key
PaymentAmount	Amount of payment to be posted
ValueDate	Value date of payment
OnAccountIndicator	Payment on account indicator
PayerParty	Business partner ID of payer
PayerContractAccountID	Contract account ID of payer
DebtorParty	Business partner ID of customer
PaymentExplanation	Payment use
ChequePayment	Check information
PaymentCardPayment	Payment card information
PostalOrderPayment	Postal order information

For incoming XI messages that refer to incoming payments, the system tries to post the payments directly. Dependent on the specifications for clearing control and the selection specifications, the payment can be posted directly. Payments that could not be posted directly receive the status R .

Contract Accounts Receivable and Payable recognizes a payment from the unique transaction ID (**PaymentTransactionID**) for each cash desk/branch (**CashPointReferenceID** / **CashPointOfficeReferenceID**).

To assign payments to a day-end closing record later, specify the grouping key. The **Enterprise Service** for the transfer of day-end closing then delivers the grouping key together with the total amount of all payments. The grouping key is unique for each cash desk/branch.

For information purposes, you can specify the business partner ID (PayerParty) or the contract account number (PayerContractAccountID) of the payer. The business partner ID is only supported as an internal business partner number (); the GUID and external business partner numbers are not supported in the standard.

At the PaymentExplanation level, you can specify the following information for the clearing control for clearing open items.

Type Definition	Name
DebtorInternalID	Business partner number (GPART)
ContractAccountReferenceID	Contract account number (VKONT)
ContractID	Contract number (VTREF)
InvoiceReferenceID	External reference document number (XBLNR)
ContractAccountDocumentReferenceID	Document number (OPBEL)
PaymentFormReferenceID	External payment form number (RFZAS)

Using the clearing amount (ClearingAmount), you can also assign partial amounts.

If you specify more than one item of information in a PaymentExplanation record, this is seen as a conjunction. You achieve a disjunction by distributing the information over several PaymentExplanation records.

You can only use information about checks, payment cards, and postal orders for offline branches, not for agent cash desks. For agent cash desks, the application of the cash desk software does the communication with the credit card company, for example. The settlement is direct between the agent and the credit card company. Contract Accounts Receivable and Payable therefore always interprets payments from agent cash desks as external (cash) payments (EXT).

Reversal of Payments

Use

Reversal of a payment in Contract Accounts Receivable and Payable

Features

With the Enterprise Service CashPointPaymentReverseNotification , you can reverse payments previously sent to an offline branch from a cash desk. However, a reversal is only possible until you call the Enterprise Service for day-end closing.

The Enterprise Service for the reversal supports individual and mass reversals.

You can read the status of a payment in the Monitor for External Cash Desk Services .

The system automatically creates a reconciliation key or reuses a relevant reconciliation key for the posting of reversals. The syntax of the reconciliation key corresponds to the form EXCYYMMTT, whereby EXC is a fixed prefix, YY signifies the current year, MM the current month, and DD the current day. The nnn places receive a sequential numbering from 001 to 999. If a reconciliation key cannot be reused on the same day, the system calls the reconciliation key with the next number.

Enterprise Service CashPointPaymentReverseNotification

Definition

Reverses payments previously sent.

Use

External cash desk systems can reverse payments that they have sent by means of SAP Exchange Infrastructure . The SAP system receives an XI message that refers to a reversal of an existing external payment and posts it directly in FI-CA. Reversals that could not be run directly receive the status D .

Structure

Type Definition	Name
CashPointReferenceID	ID of the cash desk
CashPointOfficeReferenceID	ID of the branch
PaymentTransactionID	ID of payment to be reversed
ReverseValueDate	Value date of reversal

The Enterprise Services for the transfer of payment information and for reversals of payments have a fault message that makes possible error messages visible in the XI monitor (transaction SXMB_MON). If an error occurs during processing of payments or reversals, in exception cases the system creates this fault message. As standard, the system displays payments with errors in the monitor for external cash desk services. For example, an exception is a payment that is reported twice, since this cannot be made persistent uniquely in Contract Accounts Receivable and Payable .

All levels of the XI messages offer the option of data type enhancements. With this enhancement logic from SAP Exchange Infrastructure , you can add any information to messages. Contract Accounts Receivable and Payable offers the following events:

- 6200: Add CashPointPaymentCreateNotification
- 6205: Add CashPointPaymentReverseNotification
- 6210: Add to and check external payments
- 6214: External selections for payments
- 6215: Add to selection details

Entry of a Payment with External Selections

To enter a payment with external selections, you must first execute the following actions:

1. Define the structure CI_FKKEXC_CL with the required fields as follows, for example.

   Component Component Category

   MANDT MANDT

   OFFIC OFFIC_KK

   CHDSK CHDSK_KK

   ... ...

.INCLUDE CI_FKKEXC_CL

MYFIELD

2. Add your entry/entries in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Basic Functions** > **Open Item Management** > **Define Selection Categories** . The field names must match the field names in structure CI_FKKEXC_CL and you must set the **External Selection Criterion** indicator for each field that you enter. In our example, add the following entry in Customizing:

   Application area R **Selection category** 1 **Meaning** Invoice **Field name** MYFIELD

3. Define event 6210. That is, in this event, convert the external selection criteria into internal selection criteria. You can do this as follows, for example:

```
FUNCTION Z_FKK_SAMPLE_0210.
*"----------------------------------------------------------------------
*"*"Local interface:
*"  IMPORTING
*"     VALUE(I_SELTAB) LIKE  ISELTAB STRUCTURE  ISELTAB
*"  TABLES
*"     T_SELTAB STRUCTURE  ISELTAB
*"  EXCEPTIONS
*"      UNKNOWN_SELECTION
*"----------------------------------------------------------------------
IF i_seltab-selfn = 'MYFIELD'.
 IF i_seltab-selcu = '0123456789'.
      t_Seltab-selnr = '0001'.
      t_seltab-selfn = 'OPBEL'.
      t_seltab-selcu = '000000004711'.
      APPEND t_seltab.
   ENDIF.
ENDIF.
ENDFUNCTION.
```

Repetition of a Posting

Use

You can automatically select payments received by XI and that could not be posted directly using the repetition process and trigger their posting again.

Features

You start the repetition on the SAP Easy Access screen under Payments > External Cash Desk Services > Repeat External Payments/Reversals. You can define whether unsuccessful payments are to be transferred to an existing or new (to be created) payment lot and whether the payment lot created is to be closed and, if necessary, also posted. The payments affected become a clarification case that you can process with the standard functions for clarifying payment lots.

Alternatively, you can execute the posting again directly in the Monitor for External Cash Desk Services. To do this, in the monitor, change to the Payments tab page and select the corresponding payment. Choose Repeat to post the selected payment again.

Use the Add to Payment Lot function to add the selected entries to a payment lot.

Monitoring Payments

Use

The Monitor for External Cash Desk Services (SAP Easy Access screen: Payments > External Cash Desk Services) enables you to manage and monitor payments received using Process Integration (PI). This gives you access to: master data, agent postings, successful messages for external payments, deposits, withdrawals, difference postings, G/L postings, outgoing payments, and account balances of external cash desks. You can make the data selection at the level of the external cash desk or the agent and using further selection criteria.The Monitor for External Cash Desk Services is based on the ALV technology which means that you can configure the display individually.

Features

On the Overview, XI Monitor, Payments, and Agent Postings tab pages, you can use the following functions:

Overview

Here you can select the grouping key and the master data by date and date intervals. The selection by master data delivers all payments with their respective status as well as the specification of the agent or the cash desk. The selection by grouping key delivers the status of all grouping keys for external payments. If the status is incorrect, here you can, for example, repeat postings to correct the error and then determine the new status via a refresh. You can also see the number of payments posted per cash desk/branch; they are displayed split according to successful and unsuccessful postings.

XI Monitor

This tab page shows all XI messages for an enterprise service. Here you can navigate directly to the XI messages for a message category. (However, you cannot select cash desks and branches.) Double click the document number of a payment to navigate to the document display.

Payments

At the cash desk or branch level, you can monitor all messages received from a business view. You receive information about all payments according to their respective status, which can have one of the following values:

Symbol	Status	Meaning
	P	Payment posted successfully (document number exists)
	R	Repetition planned
	P	Payment lot was created (payment lot number exists)

Symbol	Status	Meaning
	X	Item could not be processed
	C	Payment was reversed
	D	Reversal in repetition
	E	Payment reversed, no posting necessary
	P	Payment posted, document exists
	C	Reversal unsuccessful, payment lot created (The system was unable to post the reversal and has therefore created a corresponding reversal payment lot for the reversal.)

Using the pushbuttons in the toolbar above the table you can:

Pushbutton	Function
 XI	Direct call of XI message for a payment
 Repeat	Repeat posting of a payment or repeat reversal
 In Payment Lot	Addition of items to payment lots
 Payment Lot	Display of payment lots
 Note to Payee	Display of payment usage information specified (PaymentExplanation) for a payment
 Agent Information	Call of information for external cash desks

You can post payments with status R and X by choosing Payments > External Cash Desk Services > Repeat External Payments/Reversals on the SAP Easy Access screen.

By double-clicking on the corresponding symbol for an item you can display the last message for an entry.

Agent Postings

This tab page displays all payments for a grouping key. Here you can monitor individual payments of a grouping or individual XI messages. To reach a specific balance, you can manually post differences for a grouping key.

Cash Journal Operations

Here you can display information on all postings in the cash journal, along with their status. In addition, you can repeat the posting for postings that were not successful, or set their status to Manual Postprocessing Required . After manual posting has taken place, you can set the status Manual Clarification here. You can also update all postings received using enterprise services.

Cash Balance

The tab page shows the cash balance for all postings. You can check the cash balance at two different levels - for the branch or for the cash desk of a branch.

Management of Payment Lots

You can access payment lot management in the menu under Edit > Lot Management. You have to post items added to a payment lot by the repetition of the posting here. You can also close and post the payment lot created for each branch or for each cash desk of a branch. The status of a payment lot tells you whether a payment lot is to be closed, to be posted, or to be postprocessed.

Providing Information on Open Items

Use

You can swap open items for a business partner between the external cash desk system and the SAP system using SAP Exchange Infrastructure (XI).

The Enterprise Services CashPointOpenItemSummaryByElementsQueryResponse and CashPointOpenItemSummaryNotification provide open items to be paid from Contract Accounts Receivable and Payable .

The Enterprise Service CashPointOpenItemSummaryByElementsQueryResponse is also available as direct Web service.

Features

Type Definition	Name
CashPointReferenceID	ID of the cash desk
CashPointOfficeReferenceID	ID of the branch
DueDate	Due date
ReportingCurrency	Display currency
PaymentAmount	Payment amount
SelectionByDebtorPartyInternalID	ID of the business partner
SelectionByContractAccountID	ID of the contract account
SelectionByContractID	ID of the contract
SelectionByInvoiceID	ID of external reference (XBLNR)
SelectionByContractAccountDocumentID	ID of FI-CA document
SelectionByPaymentFormID	ID of payment form (RFZAS)

The cashier identifies himself at the cash desk (CashPointReferenceID) and branch (CashPointOfficeReferenceID).

The SelectionBy * selections are in table form, which means that you can specify several selections for each selection category.

Type Definition	Name
OpenAmount	Open amount
OpenTaxAmount	Tax amount of open item
DueDate	Due date
OpenItemTransactionDescription	Description of open item

Type Definition	Name
ContractAccountDocumentID	FI-CA document number
ContractAccountID	Contract account number
ContractID	Contract number
InvoiceID	Invoice number (XBLNR)
PaymentFormID	Payment form number (RFZAS)
ClearingProposalAmount	Simulated clearing amount

The system determines the description of the open items using event 6105.

If a payment amount is determined in the query, it is distributed to the open items in accordance with the clearing control and returned by means of the simulated clearing amount (ClearingProposalAmount).

You can use the XI data type enhancement for the query data type CashPointOpenItemSummaryByElemets and the response data type. Contract Accounts Receivable and Payable offers the following events:

- 6203 (External Cash Desk Services: XI Interface OpenItemRequest)
- 6204 (External Cash Desk Services: XI Interface OpenItemResponse)
- 6215 (External Cash Desk Services: Selection Details for Open Items)

Activities

In order for you to be able to read open items from Contract Accounts Receivable and Payable using the Enterprise Service , you must have defined the querying branches with their cash desk in the Implementation Guide for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming/Outgoing Payments > External Cash Desk Services > Define Cash Desk Structure.

In the configuration of the Integration Builder , link the Enterprise Service CashPointOpenItemSummaryByElementsQueryResponse_In or the corresponding Web service or the Enterprise Service CashPointOpenItemSummaryByElementsNotification_Out with the message of the external cash desks.

See also the documentation of SAP NetWeaver Exchange Infrastructure in SAP NetWeaver Library under SAP NetWeaver by Key Capability > Process Integration by Key Capability > SAP NetWeaver Exchange Infrastructure .

Querying Information on Open Items

Use

Transfer of information on open items to offline branches

Features

The Enterprise Service CashPointOpenItemSummaryByElementsQueryResponse delivers the open items for predefined selection criteria at business partner level.

Selection criteria are the ID of the business partner, of the contract, of the contract, the reference document number (XBLNR), and the document number or payment form number. You can restrict the number of items using the due date. In **Contract Accounts Receivable and Payable** , you can use the XI data type enhancement and events 6203 and 6215 to define further selection criteria or to restrict the selection.

The system can convert the amounts of the open items into a uniform currency.

The open items are returned at business partner level. In addition to the standard fields of the return structure, you can use the XI data type enhancement and event 6204 to specify further fields at open item level.

If you specify a payment amount to the Enterprise Service, the clearing proposal is simulated in accordance with the clearing control in **Contract Accounts Receivable and Payable** and returned to the caller.

Sending Information about Open Items

Use

Sending of information on open items to offline branches

Features

In the SAP menu under **Payments** > **External Cash Desk Services** > **Transfer Open Items** , you can send information about open items to external systems using a mass activity with push technology.The information is sent by means of the asynchronous **Enterprise Service CashPointOpenItemSummaryNotification** .

To enhance the message structure, use the events specified in the Querying Information on Open Items section.

Activities

1. Enter a date and an ID that you can use to identify the run later.
2. Specify the currency in which the items are to be transferred.
3. Schedule the program run. For more information, see the section entitled Functions for Scheduling Program Runs .

Processing Messages for Day-End Closing

Use

Using the **Enterprise Service CashPointClsoingDocumentNotification** , external cash desks can send day-end closing to **Contract Accounts Receivable and Payable** (FI-CA).

These messages are used for reconciliation between the individual payments and the daily totals that are forwarded to the company from external agents via the bank.

Integration

In the document display for a payment, the **External Cash Desk** tab page contains the relevant grouping key of a payment.

For documents posted via the external cash desk services, in the account balance display, you can display the grouping key used by choosing Environment > Payment Data > From External Cash Desk .

Features

Type Definition	Name
CashPointReferenceID	ID of the cash desk
CashPointOfficeReferenceID	ID of the branch
CashPointPaymentGroupReferenceID	ID of grouping key
ClosingDocumentAmount	Total amount of all payments
ValueDate	Value date of day-end closing

Activities

To enable the reconciliation between the payments received by an agent and the payment receipts forwarded to the company by the agent, the agent is managed as a business partner/contract account in FI-CA. In the Implementation Guide for FI-CA, under Business Transactions > Payments > Processing of Incoming/Outgoing Payments > External Cash Desk Services > Define Master Data for External Cash Desk Services , you must assign a business partner or contract account to external branches or cash desks. You must also make the required settings in the Define Specifications for Agent Postings activity.

In the configuration of the Integration Builder , link the Enterprise Service CashPointClosingDocumentNotification with the messages of the external cash desks by means of the SOAP Adpater or File Adpater , for example. For more information, see the documentation of SAP NetWeaver under SAP NetWeaver Library > SAP NetWeaver by Key Capability > Process Integration by Key Capability > SAP NetWeaver Exchange Infrastructure.

Transfer of Day-End Closing

Use

Transfer of payment information to Contract Accounts Receivable and Payable (FI-CA) as part of day-end closing

Integration

In the document display for a payment, the External Cash Desk tab contains the relevant grouping key of the payment.

For documents posted using external cash desk services, in the account balance display, you can display the grouping key by choosing Environment > Payment Data > From External Cash Desk .

Features

The enterprise service `CashPointClosingDocumentNotification` for the transfer of day-end closing supports both individual notifications and multiple notifications in one message. A day-end closing record contains the grouping key and the related payment total. The grouping key is reported for every payment at a cash desk for which there is a message within the period (for example, a day).

If a day-end closing message is reconciled with the individual payments, that is, the total of the individual payments is the same as the amount of the reported day-end closing, you can post a receivable due from the agent, as long as reconciliation takes place in Contract Accounts Receivable and Payable. To do so, on the SAP Easy Access screen, choose Payments > External Cash Desk Services > Post Agent Receivable. Then choose one or more grouping keys, specify a reconciliation key for the postings, and start the report. You can then process and manage the receivables from the agents using the standard FI-CA functions. For example, you can collect the receivable using the debit memo procedure as part of your standard processes.

For agents of category D, for whom the reconciliation takes place using G/L account postings in the general ledger, you can post a purely G/L account document in FI-CA, in accordance with the reported day-end closing. To do so, on the SAP Easy Access screen, choose Payments > External Cash Desk Services > Agent Posting as G/L Account Posting. This G/L account document in FI-CA is used for reconciling the cash desk closing. During the transfer from Contract Accounts Receivable and Payable to the general ledger, this document is posted as a single document. You can reconcile incoming payments of the agent using the assignment number, which is filled with the value of the grouping key in the related FI cash desk closing document. Incoming payments of the agent must have the grouping key as a reference, in order to make reconciliation possible in the general ledger using the cash desk closing documents.

The following table describes the interface of enterprise service `CashPointClosingDocumentNotification`.

Type Definition	Description
`CashPointReferenceID`	ID of the cash desk
`CashPointOfficeReferenceID`	ID of the branch
`CashPointPaymentGroupReferenceID`	ID of the grouping key
`ClosingDocumentAmount`	Total amount of all payments
`ValueDate`	Value date of day-end closing

Monitoring the Transfer of Day-End Closing

Use

Monitoring messages for day-end closing

Key Features

You can monitor and further process all day-end closing messages received in the Monitor for External Cash Desk Services on the SAP Easy Access screen under Payments > External Cash Desk Services.

The Overview tab shows the grouping keys and their further processing status for each branch/cash desk. Here you can read the previous payment total for day-end closing records that are still open. A day-end closing record is open as long as no day-end closing message has been posted for it. These records have a yellow traffic light.

Day-end closing records that have been posted have a green traffic light, or if there are discrepancies, a red traffic light. Discrepancies occur if the total of the individual payments for a grouping key does not correspond to the total amount reported in the day-end closing message.

On the Agent Posting tab, you can see detailed information for the day-end closing records. The grouping keys can have one of the following statuses:

- SPACE (Totals record received, not processed further yet)

- E (Unable to create follow-up posting)
- P (Reconciliation successful, follow-up posting created)

You can create entries with status SPACE or E at any time. On the SAP Easy Access screen, choose Payments > External Cash Desk Services > Post Agent Receivable. Or you can create entries as agent postings in the form of a G/L account posting for branch categories B and D.

By choosing the pushbutton, you can display all existing payments for a grouping key. For performance reasons the display is two-level, which means that you can first restrict the selection criteria, for example, to one customer, and then select the payments in a second step.

By choosing the pushbutton, you can post payments online that were not reported by the external cash desks, but are required for the reconciliation of the grouping key. This function is protected by the authorization object F_KK_SOND, so you can ensure that only authorized employees can make this posting.

You can call up the XI message for a grouping key in the XI monitor. Choose for a selected item.

Reversing a Cash Desk Closing Using Enterprise Services

Use

Using the enterprise service CashPointClosingDocumentERPCancelNotification_In, you can process the reversal of a cash desk closing (sent using the notification CashPointClosingDocumentNotification_In). This enables you to reverse a cash desk closing that was transmitted incorrectly by the front end, so that you can replace it with the correct cash desk closing that was sent subsequently.

Example

1. An external cash desk (front end) sends 10 messages with payments for a total amount of 500 to the SAP system (back end).
2. At the end of the day, you receive a cash desk closing message for 495 from this external cash desk. You receive a message for each cash desk, branch, and grouping key.
3. The system records the reported cash desk closing in tables DFKKEXC_SUM and DFKKEXC_SUM_HIST.
4. The system recognizes the difference of 5 between the amounts. On the Monitor for External Cash Desk Services screen, on the Overview tab page, the system displays a payment amount of 500 for the reported payments. It also shows a reconciliation amount of 495 for the reported cash desk closing.

   On the Agent Postings tab page, the system displays a payment amount of 495 for the reported cash desk closing, and a Difference to be assigned of 5.

   Due to the difference between the amount of the reported payments and the cash desk closing, you cannot post a receivable to the agent account (agent posting).
5. The external cash desk now sends you a message for reversing the cash desk closing in the amount of 495.
6. In table DFKKEXC_SUM (totals records for external payment information), the system sets reconciliation status C for the reversed cash desk closing. In table DFKKEXC_SUM_HIST (cash desk closing history), the system records the reversal of the cash desk closing, also with reconciliation status C.
7. The Overview tab page of the monitor for external cash desk services now displays a payment amount of 500 for the reported payments, but no longer shows a reconciliation amount.

On the Agent Postings tab page, the system displays the following for the reported cash desk closing: the payment amount of 495 with reconciliation status C (Totals Record Reversed), and a Difference to be assigned of 500.

8. After that, the external cash desk sends you another cash desk closing message – now with the correct amount of 500.
9. The system records the reported cash desk closing in tables DFKKEXC_SUM and DFKKEXC_SUM_HIST.
10. The Overview tab page of the monitor for external cash desk services now displays a payment amount of 500 for the reported payments.

    On the Agent Postings tab page, the system displays a payment amount of 500 for the reported cash desk closing, and no longer shows a Difference to be assigned.
11. Now you can enter the agent posting. On the SAP Easy Access screen, choose Payments > External Cash Desk Services > Post Agent Receivable.

Correcting Day-End Closing Manually

Use

In the monitor for external cash desk closing, you can manually correct a cash desk closing that was transmitted incorrectly by the front end.

Example

1. An external cash desk (front end) sends 10 messages with payments for a total amount of 500 to the SAP system (back end).
2. At the end of the day, you receive a cash desk closing message for 495 from this external cash desk. You receive a message for each cash desk, branch, and grouping key.
3. The system records the reported cash desk closing in tables DFKKEXC_SUM and DFKKEXC_SUM_HIST.
4. The system recognizes the difference of 5 between the amounts. On the Monitor for External Cash Desk Services screen, on the Overview tab page, the system displays a payment amount of 500 for the reported payments. It also shows a reconciliation amount of 495 for the reported cash desk closing.

   On the Agent Postings tab page, the system displays a payment amount of 495 for the reported cash desk closing, and a Difference to be assigned of 5.
5. You notice the discrepancy and contact the branch. The employee there informs you that the cash desk closing was for 500 and that only the message contains the wrong amount.
6. On the Agent Postings tab page of the monitor for external cash desk services, you select the affected entry and choose the Cash Desk Closing pushbutton.
7. In the dialog box that appears, you change the item total of the grouping key to 500 and confirm your entry.
8. The system records the cash desk closing with reconciliation status U (Updated Manually), both in table DFKKEXC_SUM (Totals Records for External Payment Information) and in table DFKKEXC_SUM_HIST (Cash Desk Closing History).
9. Now you can enter the agent posting. On the SAP Easy Access screen, choose Payments > External Cash Desk Services > Post Agent Receivable.

In the monitor for external cash desk services, on the Overview and Agent Postings tab pages, you can choose the History of Cash Desk Closing pushbutton to analyze changes made to the cash desk closing. This means that you can see the XI messages received for a cash desk closing, and you can see any changes made manually. To do so, select an entry in the list and choose the

History of Cash Desk Closing pushbutton. As long as the history recorded data for the selected entry (for the combination of branch, cash desk, and grouping key), the system displays this data.

Communicating Transaction Data of External Cash Desks Using Enterprise Services

Use

As part of your communications with external cash desks, you can use enterprise services in Contract Accounts Receivable and Payable to:

- Process deposits, withdrawals, and cash desk differences of external cash desks
- Enter G/L postings and down payments for external cash desks or branches
- Check the cash balances of external cash desks and payment collectors (branches)

Prerequisites

You made the required settings in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming/Outgoing Payments > External Cash Desk Services in the following activities:

- Make Specifications for Posting Cash Desk Deposits and Withdrawals
- Define Accounts for Expense/Revenue from Cash Desk Differences

Features

The external cash desk services make the following enterprise services available, whereby the transfer of data between the SAP system and the external cash desk system can be synchronous or asynchronous using Process Integration (PI) .

Enterprise Service	Function
CashPointDepositERPNotification	Asynchronous process that sends deposits made at external cash desks to Contract Accounts Receivable and Payable
CashPointDepositERPCancellationNotification	Asynchronous process that sends reversals of deposits made at external cash desks to Contract Accounts Receivable and Payable
CashPointDifferenceERPNotification	Asynchronous process that sends difference postings made at external cash desks to Contract Accounts Receivable and Payable
CashPointDifferenceERPCancellationNotification	Asynchronous process that sends reversals of difference postings made at external cash desks to Contract Accounts Receivable and Payable
CashPointWithdrawalERPNotification	Asynchronous process that sends withdrawals made at external cash desks to Contract Accounts Receivable and Payable
CashPointWithdrawalERPCancellationNotification	Asynchronous process that sends reversals of withdrawals made at external cash desks to Contract Accounts Receivable and Payable
CashPointPaymentCreateNotification	Asynchronous process that sends G/L account postings made at external cash desks to Contract Accounts Receivable and Payable

CashPointPaymentReverseNotification	Asynchronous process that sends reversals of G/L account postings made at external cash desks to Contract Accounts Receivable and Payable
CashPointERPBalanceByIDQuery	Synchronous process that requests the cash balance of an external cash desk or an external payment collector (branch)
CashPointERPBalanceByCashPointOfficeIDQuery	Synchronous process that requests the cash balance for individual external payment collectors (branches)

For offline branches and agents, SAP makes the following enterprise services available for postings to G/L accounts and in the cash journal, as well as for reports on the cash balance.

Enterprise Service	Function
CashPointPaymentCreateNotificationService	G/L account postings
CashPointDepositERPNotificationService	Posting of deposits
CashPointWithdrawalERPNotificationService	Posting of withdrawals
CashPointDifferenceERPNotificationService	Posting of differences

For the inbound XI messages, the FI-CA system attempts to generate the postings directly. The FI-CA system assigns status R to postings that it is not able to generate directly. For these failed G/L account postings, the system creates a payment lot, which you can then close and post in the monitor. If a lot receives Postprocessing status after posting has taken place, you later have to clarify the payment lot items involved.

The following enterprise services are available for reversing postings:

Enterprise Service	Function
CashPointPaymentReverseNotificationService	Reversal of G/L account postings
CashPointDepositERPCancellationNotificationService	Reversal of deposits
CashPointWithdrawalERPCancellationNotificationService	Reversal of withdrawals
CashPointDifferenceERPCancellationNotification Service	Reversal of difference postings

The SAP system receives the PI messages and posts the reversal directly in FI-CA. Reversals that the system cannot make directly receive status D.

You can optimize the runtime for message processing by setting the Optimization Active indicator in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > External Cash Desk Services > Make Basic Settings. For more information about how the system achieves this optimization, see the documentation for the indicator.

Integration with Incentive and Commission Management (ICM)

Use

If you have agents who process incoming payments, you can benefit from the integration of Incentive and Commission Management (ICM) with external cash desk services of Contract Accounts Receivable and Payable for calculating agent

commissions. Commissions can be calculated, for example, on the total value of collected payments or on the number of processed payments.

Prerequisites

You are using Incentive and Commission Management (ICM).

You made the required settings in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Processing Incoming/Outgoing Payments** > **External Cash Desk Services** in the following activities:

- **Define Specifications for Agent Commissions**
- **Define Master Data for External Cash Desk Services**

  There you activated the integration with Incentive and Commission Management (ICM) by setting the **Comm.Act.** (commissions active) indicator for the affected branches.

To establish the data exchange between Incentive and Commission Management (ICM) and Contract Accounts Receivable and Payable, you defined event 6217.

Process

If you are using Incentive and Commission Management (ICM) and you activated the integration, then the FI-CA system automatically transfers the necessary payment data to the ICM system. As a result, you can calculate the agent commissions (using the timing that suits you), and transfer the billing data back to the FI-CA system. The FI-CA system then automatically posts a credit to the agent's account.

The standard process flow consists of the following steps:

1. An agent processes payments on behalf of your company.
2. The agent reports the payment information to Contract Accounts Payable and Receivable at the end of the day using enterprise services.
3. You post all incoming payments in FI-CA under a grouping key.

   You clarify any differences that may arise between the reported payments of the agent and the posted payments.
4. As part of closing the cash desk in FI-CA, for instance at the end of the business day, you close the grouping key.
5. After closing the cash desk successfully, you use the **Post Agent Receivable** transaction (on the SAP Easy Access screen, choose **Payments** > **External Cash Desk Services**) to post the receivables to the agent accounts.

   If integration with Incentive and Commission Management is active, the system automatically transfers the data entered under the grouping key to the ICM system.
6. In the ICM system, you calculate the commission due to the agents for each grouping key. You can choose how often you want to make this calculation (daily, weekly, or monthly). You transfer the data back to FI-CA.
7. In FI-CA, the system automatically posts a credit memo document to the agent's account. For determining the main and subtransaction and the document type, the system uses the Customizing activity **Define Specifications for Agent Provisions**.

Real-Time Payments

Use

You use real-time payments when payments are initiated externally (such as on a Web interface) to forward the payment data directly to the bank and handle the immediate bank confirmation.

The following payment scenarios are supported:

- Real-time payments can be incoming or outgoing payments. Payment can be made using a bank account or a credit card.
- For payments made with a bank account, you can initially only create a payment order. When the bank confirms the payment, the system posts the payment order automatically using a payment order lot.
- For payments by credit card, you cannot use payment orders. That means, that credit cards and payment orders are mutually exclusive in the case of real-time payments.
- Business partners identify themselves by entering a bank account, credit card, or one-time payment card, or using a virtual bank account.

  For a real-time payment method of the category **Real-Time Payment Using Virtual Bank Account**, the information about the payment is already sent from the bank to your company, so that a subsequent check of whether the payment can be executed by the bank is not necessary

  ### Example

  A business partner wants to pay one of her receivables and identifies herself using a virtual bank account. You assigned the virtual bank account to the business partner beforehand. The bank forwarded a list of virtual bank accounts to you earlier. You assigned one of these numbers to the business partner.

  In event 6208, the system determines the business partner belonging to the virtual bank account.

  In event 6021 (after the selection of the items, before clearing control is called), you can restrict the selection of the items that can be paid with the virtual bank account.

  In event 6230 (after the selection of the items and after clearing control is called), you can, with dependence on the virtual bank account, check the assignment of the payment amount to the individual items, and reject the payment for example.

Features

In Contract Accounts Receivable and Payable, you handle real-time payments using the functions for processing payments at external cash desks. The system always accepts real-time payments by means of an external branch or cash desk. You have to enter an external cash desk or branch for each real-time payment.

Although the payment run neither creates nor processes real-time payments, the system uses payment methods of the **Real-Time Payment** (RTP) category to control processing. Documents, contracts, and contract accounts can contain real-time payments. The payment method can be used for the following, for example:

- Determining the format for communication with the bank

  For each real-time payment method, you define a format, as you do for creating payment media.

- Identifying an item, a contract account, or a contract as taking part in the real-time payment process

  There are events you can use, where, based on the real-time payment method, the system can derive whether an item, contract account, or contract takes part in the real-time payment process.

  In Customizing, you have to configure any payment methods that you want to use for real-time payments so they can be used in this way.

- Dunning Notices

If an incoming payment method is defined for a document, contract account, or contract, the standard system does not perform dunning, since the receivable is allowed to be collected. This logic does not apply for incoming payment methods of the Real-Time Payment category. In that case, you expect a payment. The payment run does not collect the payment, and therefore a dunning notice is created if payment is not made. With regard to payment data from the contract, see the documentation of sample function module FKK_SAMPLE_0365.

The processing logic for real-time payments is more similar to that of the payment lot than to that of the payment run:

- The bank data of the paying business partner comes from outside, is it does for payment lots.

  In the case of real-time payments, it comes from the interface of the service; for payment lots it comes from the account statement. The data is not determined during a process, as it is for the payment run.

- The house bank data originates externally.

  The interface of the service names the external cash desk and branch, from which the house bank data results. There is no bank selection as there is in the payment run. Payment locks are not included in this report. A real-time payment represents a represents a consciously-made payment on the part of a direct payer, which is always accepted.

- The system does not determine any alternative payers.

  The items to be paid are determined solely from the selection criteria. Clearing control assigns the payment amount.

- There are no payment-method-specific checks.

Real-time payments are triggered and administered using Web services. There are OData service interfaces that do the following:

- Accept and process payments (O2C_FICA_RTP_PAYMENT_SRV)
- Determine the payment status (O2C_FICA_RTP_GET_STATUS_SRV)
- Reverse payments (O2C_FICA_RTP_REVERSAL_SRV)
- Check the assignment of a virtual account to a business partner (O2C_FICA_RTP_CHK_VIRTUALACC_SRV)
- Receive and process asynchronous bank responses (O2C_FICA_RTP_COMM_IN_SRV)

Activities

1. Activate real-time payments for each company code in Customizing for Contract Accounts Receivable and Payable under Organizational Units > Set Up Company Codes for Contract Accounts Receivable and Payable by setting the Real-Time Payments Active indicator.
2. In the Define Master Data activity in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > External Cash Desk Services, for each house bank that is intended to receive real-time payments, define an external branch. In the same activity, for each house bank account, define an external cash desk with category C (Real-Time Payment) in this external branch.
3. Configure payment methods that you want to use for real-time payments in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Define Payment Methods by entering the value Real-Time Payment or Real-Time Payment Using Virtual Bank Account in the Real-Time field.
4. Make system settings for processing real-time payments in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > Real-Time Payments in the following activities:
   - Make General Settings

- Define Cash Desk Structure
- Define Master Data
- Define Cash Desk Clearing Accounts
- Define Document Types
- Define Default Payment Methods
- Enter Bank Clearing Accounts for Payment Orders and Returns

5. Activate the OData services in your SAP Gateway system.

   To do so, in Customizing for SAP NetWeaver, choose Gateway > OData Channel > Administration > General Settings > Activate and Manage Services.

   To add a service, choose  , enter your system alias and confirm your entry. Then you can add the services you want from the list.

More Information

Using Payment Orders

Processing Payment Orders

Posting of Payment/Creation of Payment Order

Use

After the items are selected and the payment amount is assigned to the items, the system either creates a payment order or posts a payment document. The system makes this decision based on the characteristics of the selected payment method.

To create payment orders, set the **Payment order only indicator** on the payment method.

⚠ Caution

For payment by credit card, it is not possible to create a payment order.

The payment method can either be specified from outside by the Web service, or the default is determined from the **Define Default Payment Methods** Customizing activity. There you specify the default payment method for virtual accounts (bank accounts only) using the type of payment processing **Real-Time Payment Using Virtual Bank Account**. Using additional entries for the type of payment processing **Real-Time Payment**, you can specify default payment methods for bank and card payment methods for the scenarios mentioned above that are not handled using virtual accounts.

In events 6021 and 6230, you can check the existence of appropriate payment methods at the level of items, contract accounts, or contracts. If a declaration of consent is required for real-time payments, you can also check the existence of one in these events.

If a payment order is created, the system records the data from the external cash desk in the payment order, so that it can be displayed there. This ensures that you can navigate from the payment order back to the real-time payment.

The data from the external cash desk is displayed on a separate tab in the detailed display of the payment order.

Activities

You display real-time payments from the SAP Easy Access screen under Payments > Real-Time Payments. The transaction calls the monitor for external cash desk services and displays the data on the Real-Time Payments tab.

In the upper screen area (Set Filter), you can restrict the payments to be displayed by status, date, and business partner. The field help for the status provides information about the individual statuses a real-time payment can have.

Payments with Credit Cards

When a payment is made using a credit card, the credit card data has to be provided by the service that transferred the payment. The credit card is authorized in event 1400 (called from event 6065). There you can also add your own customer-specific fields (from `CI_FKKOPKC`) to the credit card data. In addition, you can send authorization data already when the service is called. This data is stored in the table of card data for the payment document (`DFKKOPKC`) and is available for billing. It can also be useful to call event 1400 (from event 6065) even if authorization already took place. For example, you can add card data without needing another authorization.

Example

You add the `VANID` (Value Added Network ID) that identifies the provider that processed this card payment, so that you can display this information in the payment document.

You can add additional fields to the card supplement in event 1400 (table `DFKKOPKC`) and display them using event 1402. For more information, see the documentation for the function module `FKK_SAMPLE_1402`.

For each status change (such as, payment posted, bank was informed, bank confirmed), event 6209 is processed. This event enables you to notify a feeder system of this status change, or to otherwise react to the change.

Communication with the Bank and Returns

After the payment order or payment document is created, using event 6207, you can communicate directly with external financial institutions, such as banks, credit card companies, or virtual added networks. For this purpose, the data for the payment is made available, similarly to the logic of the payment run, in the format of the payment tables (`DPAYH`, `DPAYP`), but it is not stored in these tables.

In the format stored for the payment method, you can then create and send an XML message. If you use bank-specific formats, you can set a bank-specific format dependent on the data of the interface of event 6207. That means that you don't have to create a separate payment method for each bank.

If it is possible to send this message synchronously, the system can immediately process the synchronous answer.

If the bank confirms the payment, the system first determines if only a payment order was created, or if a payment document was created immediately. If the payment document was already created, then the system updates only the status of the external payment. If a payment order was posted, the system automatically captures the payment in a payment order lot, which you then post. In the Customizing activity Make General Settings, you can enter a prefix in the Prefix for Payment Order Lot field (see Customizing for Contract Accounts Receivable and Payable under Payments > Processing Incoming and Outgoing Payments > Real-Time Payments). The key for this payment order lot consists of the two-character prefix and the number of the payment order.

However, if the bank responds that the payment cannot be executed, the system either reverses the payment order only or creates and posts a returns lot for the payment. Which of these two takes place is determined by how the Returns Posting for Payment Order indicator is set in the Make General Settings Customizing activity. You can also define a prefix for this in Customizing. The system determines the return reason in event 6207.

If you do not set the indicator, the system reverses only the payment order. This also means that no returns activities are performed, and no bank fees are posted. The return reason (from event 6207) is noted in the payment order. To trigger follow-on activities such as creating correspondence, setting locks, or changing payment methods, use event 0695.

The indicator has no effect if instead of creating a payment order, a payment document was posted immediately. In that case, the system always creates and posts a returns lot when a payment is rejected. If a statistical down payment request was created in the case of an overpayment, the statistical down payment request is also reversed.

Both payment order lots and returns lots always contain just one individual payment or one individual return.

If the response of the bank (in event 6207) is not synchronous, the system can accept the response at a later time by calling the appropriate service separately. In that case, the execution of the steps (confirmation of the payment or rejection of the payment and naming of return reasons) corresponds largely to the description above. The data of this service is stored and processed in table DFKKEXC_ADD. If lock problems arise during processing of this asynchronous bank response, from the SAP Easy Access screen, choose Payments > Real-Time Payments and in the monitor choose .

In some cases, it's common for the bank, if payment is made using a virtual account, to immediately initiate a reversal of the payment after a certain waiting period without a response (for instance, 30 seconds). There is a separate service for reversing the payment in these cases. This data is also stored and processed in table DFKKEXC_ADD.

Transferring Payment Data by Web Service

Depending on your system settings, real-time payments can be processed synchronously or asynchronously.

In the case of asynchronous processing, the ERP system receives the data, submits it to a technical check, and then stores it in the appropriate tables of external cash desk services (DFKKEXC, DFKKEXC_ADD).

Then the processing of the payment begins asynchronously. Errors can occur, for example because business partners are blocked for this processing. In those cases, the system notes this and assigns an appropriate status. Follow-on processing might then be necessary.

Once the lock is removed, you can post the payment from the SAP Easy Access screen by choosing Payments > Real-Time Payments and then choosing in the monitor.

Or you can repeat the posting from the SAP Easy Access screen under Payments > Real-Time Payments > Repeat Posting.

You can repeat the posting until it is successful.

A service is available that enables you to find out the status of processing at any time.

Note

Repeating the posting is not recommended for payments with certain statuses. However, using event 6232, you can have the system allow a repetition, for example, even for payments with the status “Bank Was Informed, Waiting for Bank Response”. This is useful, for example, if the bank explicitly requests that the data be resent. For more information, see the documentation for the function module FKK_SAMPLE_6232.

Note

When processing a real-time payment, you can update additional log data in event 6231. You can display this data in the monitor by choosing . You can generate the log entries yourself in your own implementations of events, such as 6207, 6208, 6021, 6231, 1400, and 1402. For more information, see the documentation for the function module FKK_SAMPLE_6231.

Updating this log data can be useful, for example for tests, for researching errors, or for explaining the rejection of payments.

Processing Over and Underpayments

Use

Real-time payments can result in underpayments (partial payments). In the case of an underpayment, after the payment amount is assigned, the system automatically posts a partial payment to the selected items, and splits the items into the part paid and a remaining open amount.

You can also process overpayments with real-time payments, assuming that you have made the necessary settings for overpayments in the **Make General Settings** Customizing activity.

The following origins can be used for posting a payment document:

- 7A (Outgoing payment - bank)
- 7B (Card)
- 7E (Incoming payment - bank)
- 7V (Virtual account)

With these origins, you can make separate settings in Customizing for clearing control for these types of clearing, if needed.

If a payment amount that exceeds the receivable amount is entered for a receivable, the system creates a statistical down payment request. This request is then added to a payment order along with the actual receivable or it is posted and cleared immediately. As a result of the clearing of the statistical request, a down payment is created, that is, an item on account, that might have to be refunded later, if it is not possible to use it to clear other receivables.

It is also possible that clearing control is not able to assign the payment amount completely and instead returns payment on account postings. These postings are then also posted as statistical down payment requests, which become down payments when they are cleared.

In case clearing control does not find any items, to which it can assign the payment amount, you can configure the system (in the **Make General Settings** Customizing activity) so that the payment is posted on account. Clearing control tries to assign the payment amount to the selected open items. If it is not possible to assign the full amount, the system creates items on account. These items are posted as a down payment request with the document type entered in the Customizing activity. They are then either cleared or added to a payment order.

It is also possible to post the payment amount on account using event 6021.

Example

For an invoice of 100, a payment amount of 120 is entered.

The system creates a down payment request of 20 and clears it along with the invoice for 100.

The result is a bank collection of the payment amount of 120, and an open down payment for the amount of 20 on the business partner's contract account.

Activities

You make settings for overpayments in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > Real-Time Payments > Make General Settings.

With dependence on the transaction of the down payment request, specify if a down payment can be cleared immediately. In Customizing for Contract Accounts Receivable and Payable, choose Postings and Documents > Document > Define Account Assignments for Automatic Postings > Define Account Assignments for Down Payments and Charges.

You configure the clearing control in Customizing for Contract Accounts Receivable and Payable under Basic Functions > Open Item Management > Clearing Control.

Creating Incoming and Outgoing Payments

Purpose

This component enables you use the payment program to process incoming and outgoing payments.

Features

The payment program makes payments automatically. To do this, it:

- Determines the open items to be paid according to the selection criteria you entered for the payment run, and according to the due date of the open items.
- Groups the due items into payments or debit memos in line with industry-specific or customer-specific conventions.
- Selects the payment methods and the appropriate bank
- Posts the payment document and clears the open items
- Provides the data for the payment media

The payment medium program creates the data media. The formats required for this are supplied by SAP.

Modern payment procedures like bank direct debit, debit memo collection, bank transfer, and check are also supported, as is payment using a payment card. You enter payment procedures and the bank details to be used per business partner either in the contract account master record or (in exceptional cases) in the open item itself. If required, open items can be paid by an alternative business partner.

By setting minimum amount limits, you can prevent very small amounts from being paid. You can also block accounts or open items from being paid and enter a temporary processing block in contract accounts.

The system logs the processing steps you carry out.

Formats and Format Supplements

Definition

The payment medium format contains the technical details that control the way payment and debit orders to be sent to the bank or payment mediums for the beneficiary are to be created. The payment medium format therefore controls the payment medium program and enables you to enter the necessary settings for data transfer. Payment medium forms are defined in line with the specifications published by banks or central bank boards.

There are both document-based payment media (such as checks) and non-document payment media (DTA or EDI). There are also country-specific and international formats.

The format supplement enables you to enter a business description of the data that is to be transferred in the chosen payment medium format. You can, for example, use a format to issue payment and debit orders. In the case of debits, in some formats you have to differentiate between direct debits and collections. You make this differentiation (if required for the format) using the format supplement.

In addition to the technical characteristics of the format, company code-specific details are also required. Using these you set for each company when a cover letter (payment advice) is to be created and how the company address is to be output.

Use

The payment medium format and the format supplement are assigned to the payment method.

Note to Payee Type

Definition

The amount of space available for entering note to payee information depends on the data medium format. This space is normally a fixed number of lines (often of differing length) in which you can enter information on the line item required by the business partner.

In addition, the content of the note to payee depends on a large number of factors. This is why there is a note to payee type. It is designed to meet different content and structure requirements.

Use

You assign a note to payee type to a payment method used for a certain application area.

Structure

The structure of a note to payee can be controlled in the following ways:

- You can describe the structure in Customizing through the use of symbols. This involves the use of SAP **script** functions by which the field contents of individual items can be output. For example, the entry Amount &PAYH-WAERS(C)& &PAYP-AUGBW(C)& is replaced with the current values (currency key and clearing amount) when payment media are created.
- Alternatively, you can define a function module to create the note to payee.
- A combination is possible: First you create the note to payee in accordance with the Customizing settings. Then you can use program coding to enhance it (for example, to include certain types of greeting or special offers).

Payment Methods

Definition

The payment method defines the payment procedures to be used in a country. It also defines the prerequisites that must be fulfilled so that a certain payment procedure can be used. In the case of an automatic debit, for example, the business partner's bank details and, in the case of a returned check, the address, must be defined in the system. You must define a payment method

(in the country) and also the company code-specific details for the payment method. You also define amount limits valid for the payment procedure and other prerequisites for using the payment method.

Use

In the master records of your contract accounts, enter the payment methods that you wish to use to make automatic incoming or outgoing payments. Enter a payment method in the open item if you wish to ensure that payment is only made using this method. This payment method does not have to be included in the master record for the contract account.

Integration

The payment medium format used for payment methods must be assigned to the payment method. This can include the process of assigning a commercial description to the payment method and making your Customizing settings for the note to payee.

For outgoing payments in Switzerland, Contract Accounts Receivable and Payable supports the POR payment procedure.

Payment Agreements

Use

If a business partner pays his liabilities in a currency different to the currency of the open receivables, you can agree on the amount to be paid with the customer and enter it in the system. The exchange rates configured in the system are not considered.

Features

When you clear an open item with a payment agreement, any differences that arise are posted as exchange rate differences. You can define agreements for payment amounts for credits and liabilities. You can also restrict the validity of an agreement to a specific period.

You cannot define a payment agreement for items for which a payment specification or debit memo notification exists.

Activities

If you want to make payment agreements, activate the function in Customizing for Contract Accounts Receivable and Payable under **Basic Functions** > **Postings and Documents** > **Basic Settings** > **Maintain Central Posting Settings** by setting the **Payment Amount Agreement Possible** indicator.

On the SAP Easy Access menu under **Payments** > **Agree Payment Amounts**, you can maintain payment agreements in any currencies. You do this as follows:

1. Select the open items, for which you want to make an agreement, by business partner, contract account, contract, and company code, and net due date if necessary, and specify the agreement currency.

   If you want to create a payment agreement for the total balance of a business partner (irrespective of the transaction currency of the individual open items), set the **Select All Open Items** indicator

2. Choose the **Open Items** pushbutton.

   Items for which there is a payment specification or a debit memo notification are not selected.

3. If you want to create a payment agreement for the total balance of several business partners, choose the pushbutton with the quick info text **Select Further Items** to make further selections.

4. Select the items for which you want to make the agreement.

   Double click the document number to navigate to the document display.

5. Under **Agreement Data**, the system totals the items in the original currency and displays the amount to be paid in the agreement currency according to the exchange rate table. In the **Amount to be Split** field, enter the payment amount that you have agreed on with the business partner and choose **Continue**.

6. Save your entry.

The system automatically splits the agreed amount over the selected open items proportionately and outputs the exchange rate resulting from the agreement.

If you have selected open items where the transaction currency and the agreement currency are the same, the system sets the agreement amount to the original amount and distributes the remaining amount to the other open items proportionately.

In the columns of the table containing the items, you can also define a date to which the agreement is to be valid. By setting the **Evaluation in Payment Run** indicator, you can determine whether the agreement is only valid for clearing online or also for processing using the payment program.

If you create payment agreements for the total balance of a business partner, during the automatic distribution of the agreement amount, for all items where the transaction currency is the same as the agreement currency, the system sets the agreement amount to the original amount and distributes the remaining amount proportionately to the other open items.

Consideration of Direct Debit Limit

Use

For a contract account with an incoming payment method, you can define a direct debit limit for each period. This enables you to prevent, in the specified period, that a higher amount than desired is collected for the contract account (even though there are due items, an incoming payment method, and bank details).

Features

You activate the direct debit limit for each paying company code and you should also define the direct debit limit in the currency of the paying company code, since otherwise the system converts all payments into the currency of the direct debit limit.

In the definition of the direct debit period, you can define that all payments of the last N months are to be considered, or all payments since the first day of the current month, or since the first day of a specific previous month.

The system records each direct debit in a separate table. You can display a list of the direct debits from the master data transactions. (In the SAP Easy Access menu, choose under **Master Data** > **Business Partner** > **Contract Account** > **Display**).

The system indicates returns for recorded direct debits accordingly and they no longer contribute to the degree of utilization.

The payment run determines and adds together the direct debits in the period under consideration. The payment run checks whether the current amount to be collected can be collected in total or only in part, or not at all. If it cannot be collected at all, the items are displayed as an exception with the indicator 80 (**direct debit limit reached**). If the amount can be partially collected, the new event 0613 is processed. Here, for example, the call of the clearing control (with clearing type 06D) can distribute the collectible amount to the items. The items that cannot be collected become payment exceptions again with indicator **80** .

Activities

You activate the direct debit limit for a paying company code in Customizing for **Contract Accounts Receivable and Payable** by choosing **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Define Specifications for Paying Company Code** . For the paying company code, set the **Direct Debit Limit Active** indicator. (To do so, double click on the paying company code.)

In master data maintenance, the system displays the fields for the direct debit limit only when this indicator is set in the paying company code.

When you create a contract account, the system does not display the fields until the indicator is set in at least one paying company code, since in this case, the paying company code for the current contract account is not known (since it has not been entered yet).

Payment Specifications

Use

You can summarize receivables that a business partner is to pay with **one** payment, using a specific payment method, and specific bank details, and payables that you want to pay to a business partner into payment specificationsfor automatic processing in the payment program and processing in payment lots.

Integration

In the document display, the payment data shows that a line item has been included in a payment specification. Navigation to the payment specification is supported.

For the display in the account balance, you can include the field PDTYP (**Category of Payment Specification**) in the line layout. You can also display the field IPAYD where an icon indicates whether an item is assigned to a payment specification or not.

Features

With the transaction **Payment Specification for Payment Run** , you can group open items and at this level, define payment data such as payment method, bank data, and DME data. The payment program processes this data for payment (payment specification of category **Payment Program**).

You can also only group items using the transaction **Payment Specification for Payment Lot** (for example, without specification of payment data such as payment method, bank data) and use the payment specification thus created as selection criteria for the processing of incoming payments (payment specification of category **Valid for Payment Lot**).

The system saves this payment data at header level and the related items at item level in the object payment specification.

You can include items from different business partners and contract accounts in one payment specification. In the payment specification you must always specify the paying business partner and (if the specification is for the payment run) the paying contract account. You can use the function for incoming payments, outgoing payments, and in principle, for all payment methods. In the related line items, only the category of the payment specification (field DFKKOP-PDTYP) is set. The payment data entered (for example, payment method) is not entered in the line item.

When you create a payment specification, the same authorization checks that apply to the document change function apply (company code, business area, and authorization group of contract account). Using the authorization object F_KKINDPAY, the system checks, dependent on the category of the payment specification and the activity, whether a user has the required authorization.

Activities

When you create/change a payment specification for the payment run, you can select either all items or only preselected items. You define the default for each user in the user parameter 8PAY_XITMS (A = all items, R = only preselected items).

You define screen variants for payment specifications in the Implementation Guide for **Contract Accounts Receivable and Payable** , under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation.** You define the default user-specific in the user parameter 8IP.

If you define event 0606, when you post the document you can define for each business partner item that a specification is required for the item. This means that the payment run does not pay this item until a payment specification has been created for it. Items of this category are preselected items.

If you define event 0616, on the initial screen of the transactions for creating a payment specification (and in the dialog box for subsequent selection of additional items), you can define additional selection criteria. This means that from the list of selected items, you can display only certain items (filter function) by evaluating your selection entries in the module specified here.

At event 0609 you can visualize customer-specific fields that you have defined in header table DFKKIP_GRP using a CI include in the creation, display, and change transactions. Your own fields are then displayed on a separate tab page.

Limitations

Cash discount and withholding tax

Items relevant for withholding tax must not be included in a payment specification and this is also not supported in event 0606.

Items with cash discount also cannot be included in a payment specification.

Payment locks/clearing locks

Items with payment locks cannot be included in a payment specification for the payment run. The payment lock prevents the items being paid and from being included in a payment specification. No payment locks (in FPE2, FPE2M) can be set for items in a payment specification. In the case of a payment with payment specification, the payment locks of the items assigned are no longer analyzed.

You cannot include items with clearing locks in a payment specification for the payment run or in a payment specification for the payment lot. These items are locked against any clearing.

The payment locks at master record level (contract account or contract) can be interpreted using event 0617, as described in the section Processing by Payment Run/Payment Lot .

Repetition items

You cannot define repetition items for a payment specification during posting (event 0606). If you assign these to a payment specification in the create and change transactions (FPAY1A/FPAY1B/FPAY2), the system releases the repetition items.

Creating Payment Specifications

Use

You create payment specifications to group items into one payment.

Activities

1. On the SAP Easy Access screen, choose Payments > Payment Specification > Payment Specification for Payment Run or Payment Specification for Payment Lot.
2. Enter parameters for the selection of the items and a line layout variant, and confirm your entries.
3. On the Basic Data tab, make the following specifications for the payment:
    - Payer (business partner, contract account)

      You can define a default value at event 0618.
    - Payment method, paying company code
    - Bank details/card details of business partner
    - Bank details of company (house bank ID, house bank account ID)
    - Run date
    - Text for payment (optional)
    - Reference number for payment (optional)

    On the Additional Data tab, you can enter data for the commitment item and the creation of the payment media (DME data, such as recipient code and instruction key).

ℹ Note

A line item cannot be included in several payment specifications of the category Payment Lot at the same time. This means that for one item, you cannot make specifications in different currencies, for example, and then, when an incoming payment in a specific currency is received, mark the payment specification that was used, and then delete or archive the other specifications not required, at a later date.

You can also create payment specifications without an item reference. The system creates a header record, but no item records. You can assign the related items to the payment specification later.

Items, for which there is a payment specification of the category Payment Run, are protected from clearing in other clearing processes (except for the payment run). Information to this effect appears in the status display of open item processing.

Changing Payment Specifications

Use

You want to change the data of an existing payment specification.

Procedure

1. To change a payment specification, in the SAP menu choose Payments > Payment Specification > Change .
2. Identify the required payment specification using the specification or reference number.
3. Choose Continue .

If you change a payment specification and want to include items in the specification, you have to select the items to be included before you save. If you want to remove items from a payment specification, you have to deselect them before you save.

You can implement additional checks that have to be carried out when a payment specification is changed via event 0607. There you can return error messages that then appear in a separate dialog box.

You can implement the update of own data after a change to a payment specification using event 0608.

Displaying Payment Specifications

Use

Displaying payment specifications and line items contained in payment specifications

Procedure

You can display payment specifications from the SAP menu by choosing **Payments → Payment Specification → Display** . Selection is by means of the specification number or the reference number. If you set the corresponding indicator, the system also accesses payment specifications that have already been archived.

Report RFKKIP01 provides an ALV list of all payment specifications from the SAP menu under **Payments → Payment Specification → List** . Double click in the list to display the details for a payment specification. In the document display of an item that is part of a payment specification, you can click on the pushbutton **Payment Specification** in the payment data to access the details for this payment specification.

Report RFKKIP03 provides an ALV list of all line items from the SAP menu under **Payments → Payment Specification → Listof Assigned Line Items** . You can also double click in the list here to display the details of the payment specification.

Report RFKKIP02 provides an ALV list of all line items that are preselected for a payment specification but have not yet been included in a payment specification (SAP menu: **Payments → Payment Specification → List of Preselections**).

Approval and Release of Payment Specifications by Workflow

Use

You want to subject the creation and change of payment specifications to an approval process.

Features

When you create or change a payment specification, the workflow for check and approval in accordance with the dual control principle can be run.

You cannot change a payment specification with the status to be approved until it has been approved/rejected.

For a change that is subject to approval, the payment data is stored with the status **To Be Approved.**

When you change a payment specification, the system writes history records for the header data; it then displays these on a separate tab page in the display. The person actually doing the approving also sees which change needs to be approved. When you include new items or remove items, the new items or items deleted are also displayed on separate tab pages if the change is subject to approval. Each item contains information about when it was included in the payment specification.

If the payment specification is accepted, the check indicator is automatically removed from the payment specification and the payment specification receives the status **Approved** .

If a payment specification is rejected, it receives the status **Rejected** . In the line items assigned, the reference to the payment specification is automatically removed.

Activities

You decide whether the creation/change must be approved in event 5514; the relevant business object is CA_INDPAY. In addition to the status field (open/to be approved/approved), the **Complete** attribute exists. This must be set if the payment run or payment lot is to use a payment specification. This attribute can control the start of the approval workflow. For example, event 5514 can be so defined that the workflow only starts if the **Complete** attribute is set. This means that different users can carry out different changes without having to have each individual change approved before the next clerk can process the payment specification further.

Processing by Payment Run/Payment Lot

Use

Processing of payment specifications in the payment run and payment lot

Features

The payment run pays only complete payment specifications that have the status **Open**, **Approved**, or **Reopened after Reversal of Payment**. The payment run does not pay payment specifications that are in a workflow with the status **To Be Approved**. Instead it creates a payment exception. The changes from the workflow process (approval or rejection) are documented accordingly in the status.

Since you can group items from different business partners, the use of payment specifications is not suitable for parallelization using business partner intervals in the payment run. Items that the payment run reads in interval 1 (contains the business partner) are skipped here. In interval 2 (contains the payer), the payment run reads the items read in interval 1 again, since all related items have to be determined here.

> **Note**
> This second reading of line items increases the runtime of the payment run, which means that the procedure should not generally be used as a replacement for document changes (for example, entering payment method and bank data).

If the payment run makes the payment successfully, the system enters the number of the created clearing document (or payment order) and the payment run ID in the payment specification. The system displays this data on a separate tab. From this tab, you can navigate to the payment document, the payment order, or the display of bank data from the payment run, and from there to the payment run display. The following new exceptions can occur in the payment run:

- 66 **Payment Specification Still Has To Be Approved**
- 68 **Amount of Payment Specification Does Not Correspond to Item Total**
- 69 **Payment Specification Is Locked by Online Processing**

When processing a payment specification, the payment run considers any existing payment and clearing locks in the contract account to be paid. The payment run does not consider locks on the assigned contract accounts of the line items unless you have defined event 0617 accordingly (see below). Locks cannot exist on the assigned line items themselves, since locked items cannot be included in a payment specification for the payment run and no locks can be set for items in a payment specification.

The payment run does not consider custom selections (selection, for example, by document number or posting date) for the assigned items of a payment specification, since a payment specification can only be paid completely or not at all (and not partially).

The following logic applies for the interpretation of the payment data (header level):

The payment run treats the payment method, paying company code, bank details, card details, and own details as if they had been entered at item level and includes them in the payment data (DPAYH) such that they appear in the payment list and on the payment media printout.

The payment run evaluates your own bank details regardless of the indication of the payment method for controlling the bank selection (transaction FQP4). However, you can override this logic at event 0650.

The execution date is transferred to the payment data (DPAYH) and overrides the otherwise applicable standard logic. The standard logic determines the execution date from the due date of the items to be paid (for collection and several items with different due dates: the latest date; for outgoing payments: the earliest date). The payment run replaces an execution date in the past with the current date. Since not all payment media formats support an execution date at the individual payment level sometimes such a date is only supported for the complete file it can be necessary to agree with the receiving bank to what extent a file with payments with different execution dates can be processed.

The system transfers the DME data to the payment data (DPAYH) and overrides any specifications from the module in event 0630.

The text for the payment is not saved in the payment data (DPAYH) and is therefore not visible in the payment list. You can determine this text when the file is created by reading the data from the payment specification the key is in the payment data and noting it in a suitable place on the payment medium.

Partial payments are not possible with payment specifications. Event 0610 is therefore not processed in the payment program when you process payment specifications. Partial payment is also not possible if you use a payment specification as the selection criterion in the payment lot (comparable with the use of payment advice notes). In contrast, overpayments are possible in the payment lot and lead, for example, to postings on account or to other items being cleared.

Activities

If you define event 0617, you can turn a payment specification that the payment run considers to be payable into a payment exception by returning a corresponding item indicator (and corresponding message). For example, in this event, you can determine the payment locks of the contract accounts/contracts involved and prevent payment if a contract account of an assigned item has a payment lock in its master record. To put this into effect, you can use module FKK_SAMPLE_0617_PAYMENT_LOCKSV, or use it as a template for your own module.

Integration in Follow-On Processes

Use

Integration of payment specifications in follow-on processes

Features

Reversal of document

If a document still contains items that are assigned to a payment specification, you have to remove this assignment before you can reverse the document.

Reversal of posted payment document

If a payment document is reversed, the payment specification receives the status **Reopened after Reversal** . The cleared items are open again and still assigned to the payment specification. You can pay them again. Using report RFKKIP01 (SAP menu: **Payments** > **Payment Specifications** > **List**), you can select all payment specifications with the status **Reopened after Reversal** and decide what to do with them. You cannot reverse a reversal of this kind.

Reset of clearing of posted payment document

If clearing is reset, the payment specification receives the status **Clearing Reset** . The assignment of items cleared earlier to the payment specification is also reset. You cannot use the payment specification again.

Return for posted payment document

If there is a return, the payment specification receives the status **Return** . The cleared items are open again and still assigned to the payment specification. You can pay them again. Using report RFKKIP01 (SAP menu: **Payments** > **Payment Specifications** > **List**), you can select all payment specifications with the status **Return** and decide what to do with them. All returns activities (setting locks, correspondence) refer to the paying contract account specified in the header of the payment specification (and not to the contract accounts of the related items posted to). Exception: Any charges arising are posted to the contract account with the highest item.

Reversal of payment order created

If a payment order is reversed, the payment specification receives the status **Reopened after Reversal** . This reopens the cleared items. You can pay them again.

Using the Payment Program

Purpose

The payment program pays the open items due of all the business partners or contract accounts you selected. It can be used to process both incoming and outgoing payments.

Prerequisites

Customizing Settings

The following Customizing settings are necessary for the payment program (see Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation**):

- Definition of payment methods
- Structure of note to payee
- Company code data
    - General

      Payment is not made if the item to be paid is smaller than the minimum amounts that you enter here. You can, however, override this setting by entering the payment method in the line item. This enables you to clear residual amounts following contract termination.
    - Payment medium format settings
    - Payment method settings

- Determination of value date

  To determine the value date in the payment document, the system adds the number of days that you specify in the parameters here until the value date to the posting date of the payment run.

- Account determination - dependent on the processing type you specified for the payment method:

Processing Type	Account Determination
Bank account	The system automatically determines a bank clearing account for the bank line in the payment document. In Customizing, you can define the G/L account differentiated by house bank, account ID, payment method, and currency of the payment (in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Define Bank Accounts for Payment Program)
Internal clearing	An open item is automatically generated in the deposit account for the Insurance industry component.
Payment card	A posting is made to the reporting account defined in Customizing (see Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Payment Cards > Define Accounts for Payment Card Institute).

Contract Account Specifications

In the contract account, the process flow of the payment program is influenced as follows:

- Paying company code

  The paying company code is determined from the company code group of the contract account. Payment method determination, house bank determination, bank line item of the payment document, the sender of payment orders, and other details are all determined by the paying company code.

- Contract account used for payment in payment transactions

  By specifying another contract account for the business partner, you can pay the items of both accounts together. The following details that are required for payment are determined solely by the contract account used to settle items:

  - Payment method
  - Payment lock
  - Processing block for a limited time (for debit memos)
  - Alternative payer
  - Payer's bank details
  - Payer's payment card ID

Line Item Specifications

The following details that the payment program takes into account in the open item can partly override the details defined in the contract account:

- Due date details (net, cash discount, deferral)
- Payment method
- Payment lock
- Alternative payer
- Payer's bank details
- Grouping term
- Indicator that the item can be cleared against other items only

Payment Run Specifications

You must also maintain the parameters for the payment run, restrict the quantity of data to be processed (by company code, business partner, contract account, due date period), control the bank selection, enter posting parameters, and make any other control settings. For more information, see Functions for Scheduling Program Runs.

Process Flow

When you start a payment run, the payment program carries out the activities described in the following topics:

1. Selecting Open Items
2. Grouping Items to Be Paid
3. Items with Special Treatment
4. Selecting Payment Methods and Bank Details
5. Value Date and Account Determination
6. Posting Payments and Providing Payment Data

Result

Following a successful payment run, the open items are cleared by payment documents and the data relevant for the payment media is saved. If you selected the indicator for an additional log in the payment run parameters, you can now refer to this log for further details on the program run. However, it only makes sense to do this in the test phase, or during problem analysis. You are not allowed to create a full additional log in a mass run. You can print the created payment data using the payment list, if required.

Selecting Open Items

Before open items can be combined into groups for payment, they must first be selected. In a second step, the system then attempts to find a suitable payment medium/house bank combination for these groups.

The process of open item selection takes place in several stages:

1. Sort sequence
2. Open items are selected either sorted by business partner or by contract account. The sort sequence is governed by the selections entered in the parameters: If the selection is according to contract accounts, importing sorted according to business partners is not possible. (This has the disadvantage that it is not possible to clear items of different contract accounts of one business partner). Open items are otherwise always imported sorted by business partner.

3. Parallel Processing

4. Under the technical settings for the payment run parameters, you can control whether the payment program is started on several applications simultaneously. Parallel processing involves dividing the data to be processed between several machines, enabling higher throughput. Provided the datasets selected are not too large, you can access data more quickly and less memory is required during data processing.

   You achieve parallel processing by dividing up the data that is to be processed. Suitable objects on offer for this parallel processing include the business partner and the contract account, (depending on the chosen sort sequence, see above).

5. Due date determination

You specify a due date period under the payment program parameters. An item's due date is calculated from the:

- Deferral date (if entered in the open item)
- The due date for cash discount (provided this date precedes the posting date entered in the payment program parameters).
- The due date net (if the date to qualify for cash discount has already expired).

An item is due (and therefore included for payment by the payment program) if the due date determined as above lies within the relevant due date period.

Grouping Selected Items

The payment program groups the items due for a business partner into payable groups. This is only possible when all the items of the business partners are considered as a whole - meaning that the selection of the items is not sorted according to contract accounts. Items can be grouped by the following criteria:

- Business partner
- Alternative payer
- Payer's bank details
- Paying company code
- Contract account for payment
- Payment method
- Payment lock
- Currency key
- Grouping term from open item
- Free grouping of application area

In the clearing control in Customizing for Contract Accounts Receivable and Payable (under **Basic Functions** > **Open Item Management**), you define which items are grouped as one unit in a clearing activity and in which order the program processes the items in a group or the individual groups. In addition to this standard grouping, you can refine the grouping of the items using characteristics that you define. You make the relevant settings in **Enhanced Grouping** (under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation**). For information on whether these criteria are taken from the contract account or the open item, see Making Payments Using the Payment Program. You can enter data for your application area in a separate grouping field in event 0600. This data could include, for example, reference details from the contract. You can also lock items for the runtime of the payment program in event 0600. To do this, program a function module and define it in event 0600 in

Customizing for Contract Accounts Receivable and Payable under Program Enhancements > Define Customer-Specific Function Modules.

Cross-Business Partner Payment

Use

If the paying business partner is not also the holder of the contract account for which the items are to be paid, you can enter an alternative paying business partner. This ensures that the open items for the affected business partners (account holder and payer) are paid together with one payment.

Integration

In the contract account, you can specify another paying contract account for the same business partner, just as you can for a contract account. This ensures that open items for both accounts are paid together with one payment.

Prerequisites

Collective payment is only possible if the parallel processing object for the payment run is the business partner.

Features

The following example is to clarify cross-business partner payment.

Business partner	Contract account	Paid by business partner	Paid by contract account
SON	V-SON	FATHER	V-FATHER
DAUGHTER	V_DAUGHTER	FATHER	V-FATHER
FATHER	V-FATHER		

This means that the open items for the SON and DAUGHTER business partners are collected together with the open items for the FATHER business partner, along with the payment method in the account V-FATHER. Only one debit memo collection takes place from the V-FATHER account.

In this case, the payment data for the business partner V-VATER is also valid for the payment of items on the V-SON and V-DAUGHTER accounts.

Locks on the V-FATHER account prevent the collection of items on the V-SON and V-DAUGHTER accounts. However, locks on the V-SON account only prevent the collection of items on the V-SON account, but not the collection of items on the V-DAUGHTER or V-FATHER accounts.

The payment run skips the items for the V-SON and V-DAUGHTER accounts. These are not included in the log. The items from V-SON and V-DAUGHTER are only reread and paid when processing the items for the V-FATHER account.

The items for the V-SON and V-DAUGHTER accounts are **not** paid, if the payment run does not select business partner FATHER.

Activities

1. To define an alternative payer, choose one of the following paths:

Roles

Process contract account master data > (SAP_FI_CA_CONTRACT_ACCOUNT) > Change contract account

SAP Menu

Master data > Contract account > Change

1. Enter the appropriate contract account, for which you want to define an alternative payer, and choose Continue.
2. Choose the Payments/taxes tab page, and define the alternative payer there in the Alt. payer field in Incoming payments .

Items Requiring Special Processing

Once items have been grouped together for payment, the system determines the balance per group and checks whether a payment method is defined in the contract account master record or in the line item. If the account has a debit balance and there is no payment method specified, the payment program skips the group, assuming that the payer is a self-payer.

The program also checks the following details and processes the line items accordingly:

- Locks and partial payments

  If either the line items belonging to the group or the contract account via which payment is made are locked, the line items are locked for further processing. You can analyze these exceptions later using the payment list.

  The application area can use event 0610 to analyze the entire group. Depending on information and those dependencies that can be taken into account by the application area only, line items can either be partially paid or excluded from the payment process altogether.

- Check for minimum amount

  The system checks the minimum amount you defined in Customizing for the paying company code dependent on the balance (and provided you did not enter a payment method in the open item).

- Items that can only be cleared

  By selecting the relevant indicator in the line item, you tell the system that an item payable to a business partner is to be used only to reduce debit entries from this partner (the amount cannot therefore be paid out), or that a debit entry can be used only to reduce the amount to be paid out (that is, the amount cannot be collected). If the total of the items selected is greater than that of the items not selected, you can use event 0615 to decide whether and which items are to be used for clearing.

Selecting Payment Methods and Bank Details

Once the open items have been grouped and the balance per group has been established, the system then determines the payment method and the house bank:

You define the order in which the suitability of payment methods is checked in the list of payment methods under the payment run parameters.

If you process a group containing items in which the payment method is defined in the line items, the system checks whether the payment method appears in the list of payment methods.

In the case of groups where no payment method is entered in the line item, the system checks only those payment methods in the list that are also defined in **Contract Accounts Receivable and Payable.** If there is no overlap, payment cannot be made. If more than one payment method could be used, the system carries out the checks listed below in the specified sequence until it finds a suitable payment method.

Example

From the list of payment methods, you choose **Bank direct debit** , **Bank transfer** , and **Check** (in this order).

- If you entered payment method **Collection** in the line item, this group cannot be paid.
- If you entered payment method **Bank direct debit** for a contract account with a debit balance, the system checks this payment method.
- If you entered payment methods **Check** and **Bank transfer** for a contract account with a credit balance, the system checks the payment method **Bank transfer** first. If the system is unable to find a bank, it searches again under the payment method **Check** .
- For each payment method, the system then checks whether the conditions entered in Customizing are satisfied (business partner address or bank details required, foreign currency permitted).
- Finally, the system searches for a suitable house bank per payment method by checking the banks you entered in the parameters for the payment run. If you specified payment optimization under the field **Bank Group** in the bank master record, the system attempts to select a house bank that is suitable for business partner bank's bank group. No bank selection takes place if the payment method is marked as **Internal settlement** or as the payment method for payment cards . In event 0650, you can override the selection of the house bank determined by the payment program, and set a different house bank ID dependent on the items to be paid or prevent the payment (see the documentation for the function module FKK_SAMPLE_0650).
- Then, in event 0652, you can override the automatic selection of the partner bank by the payment program (from the account, the contract, or the line item), and set a different bank details ID dependent on the items to be paid or prevent the payment (see the documentation for the function module FKK_SAMPLE_0652).

SEPA Direct Debits

Features

Entering, Displaying, and Changing Mandates

SAP supports you in processing and managing SEPA direct debits and SEPA bank transfers in conjunction with the Single Euro Payments Area (SEPA), which has as its goal the creation of a single European payments area. Mandates are granted by a paying party to a creditor as part of a direct debit procedure. In the SAP system, for mandates, you can:

- On the SAP Easy Access screen under **Payments** > **SEPA Mandates** , create, change, and display mandates
- In the transaction for processing business partner data on the **Payment Transactions** tab by choosing the **SEPA Mandates** pushbutton, enter and display mandates for certain bank details or for the business partner

  If you select certain bank details, you can enter and display the mandates for those bank details. If there are no bank details yet for the business partner, you can enter and display mandates for the business partner even without selecting bank details. This situation can arise, for example, if you have sent mandates without knowing the bank data, in order to find out the bank data.

If multiple bank details are available and you do not select specific bank details, the system displays the mandates for all bank details on one screen.

- In the transaction for processing bank data, on the SAP Easy Access screen under Master Data > Business Partner > Change Payment Data, create, change, and display mandates for bank details

  If a mandate already exists, the system displays an icon for displaying and changing the mandate. If no mandate exists, then an icon appears that you can choose to create new mandates.

You can display all mandates in the form of a list. On the SAP Easy Access screen, choose Payments > SEPA Mandates > List. You can also initiate a mass change of mandates. For more information, see the report documentation.

Evaluation of Mandates in the Payment Program

The payment program checks the existence and validity of the SEPA mandate. The system stores the ID of the SEPA mandate in the payment data, and generates a SEPA-specific payment medium as a result.

Payment Medium

For more information about the creation of payment media for SEPA, see SAP Note 1893915.

Integration with Sales and Distribution

If you process billing documents from Sales and Distribution (SD) in Contract Accounts Receivable and Payable, then Contract Accounts Receivable and Payable copies the SEPA mandate ID from the SD billing document header to the open items.

If you enter a SEPA payment method, you can enter the SEPA mandate to be used when you enter or change an SD order. The payment run in Contract Accounts Receivable and Payable requires the bank details of the business partner, but this information is not stored in the SD order. When the document is posted in Contract Accounts Receivable and Payable, the system determines the bank details of the business partner from the IBAN of the mandate and stores the information in the FI-CA document.

If you enter the mandate reference when entering an order in Sales and Distribution (SD), the system transfers this mandate reference to the related business partner item in Contract Accounts Receivable and Payable. The payment run then takes the reference into account.

Printing Mandates

You can print out mandates and also repeat the printing. For printing mandates, SAP provides the sample forms `SEPA_MANDATE` for `PDF` and `SEPA_MANDATE` for `SMARTFORM`. You can also print using SAPscript. We do not, however, provide a template for this.

In the standard system, you can print mandates immediately using the pushbutton. The mandates are printed immediately on the output device specified by you. The system does not create an entry in the correspondence container. This means that the correspondence history does not display the correspondence.

You can also process printing using the correspondence container. In Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Management of SEPA Mandates > General Settings, enter function module `FKK_MANDATE_GEN_BUTTON_PRINT` as the parameter Function Module for "Print Mandate" Button in the Other Parameters group box. The following printing options are available:

- Print by entering the printing parameters

  When you choose the pushbutton, you enter the printing parameters, such as form and output device, on the subsequent screen. You can then decide whether to print the mandate immediately using the specified printer (pushbutton) or whether to set the mandate in the print dataset (pushbutton). In this case, the mandate is printed in the correspondence print run that you schedule periodically (see Scheduling Correspondence Printing Runs).

- Print without printing parameters

  When you choose the pushbutton, the system creates a correspondence request that you print out in the periodically scheduled correspondence print run.

In both cases, the correspondence history displays the correspondence.

Visibility of Mandate Fields

In Customizing, you can suppress the display of mandate fields at different levels. Specify the levels at which mandate fields are hidden in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Management of SEPA Mandates > Hide Mandate Fields.

More Information

For more information about printing, see SAP Note 1885676.

Use of SEPA Mandates by Multiple Applications

Since SEPA can be used by various applications (FI-CA, FI-AR, Banking) — in the same system and client — the system stores the application in the mandate. If you use only one of these applications, then the system treats it as the default application. If you use more than one of these applications, then the SPA/GPA parameter SEPA_ANWND determines the default application. You can still change the application nonetheless. If more than one affected application is active in your system, then on the initial screen for creating a mandate in dialog mode, choose the Switch Application pushbutton in the toolbar (SAP Easy Access screen: Payments > SEPA Mandates > Create). The system displays a list of all active applications, from which you can choose the application you want.

When you display or change a mandate, the system determines the default application using the application stored in the mandate.

Creating, Displaying, and Changing Mandates

Use

The dialog transactions for creating, displaying, and changing SEPA mandates can be found on the SAP Easy Access screen under Payments > SEPA Mandates.

Prerequisites

- For processing SEPA direct debits, you made general settings and general specifications in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Management of SEPA Mandates.
- For assigning the mandate reference, you have entered the corresponding number ranges in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Management of SEPA Mandates > Define Number Ranges for the Mandate Reference.

Features

In the dialog transactions for creating, displaying, and changing mandates, you can select data on the initial screen using the following criteria:

- Mandate
- ID of vendor
- IBAN
- Business partner
- Contract account
- Contract
- Company code

If the system determines there is more than one mandate that meets the criteria, then it displays the results in a list in a dialog box. Double click on a row in the list to see detailed information for it. In the detail view, the data for the mandate is displayed on the following tab pages:

On the initial screen, you can lock all existing mandates for the IBAN of the business partner and the vendor ID by choosing the pushbutton  in the toolbar.

Tab	Function
Basic data	Shows the status, the validity, and the administrative data
Payer	Shows the address and bank data of the payer of the mandate (business partner)
Payee	Shows the address of the payee of the mandate (company code)
Use	Shows the use of the mandate by the payment program
Versions	Shows older versions of the mandate

When you save, the system creates a twelve-character ID (the mandate reference) in the standard system for each mandate. The system uses the number range object FKK_SEPA to determine the mandate reference number. If you want to have a reference that differs from this standard setting, then define event 0570.

The functions for creating, displaying, and changing SEPA mandates are protected by authorization objects F_KKSEPA and F_SEPA_MDT.

More Information

For more information about the number ranges for the mandate reference, see SAP Note 1894342.

Maintaining Mandates in Payment Data Processing

Use

You can create, change, and display mandates not only in the dialog transactions specifically for this, but also in the processing transaction for payment data.

Prerequisites

For you to be able to create mandates for bank data with the status Active, an IBAN has to be entered in this bank data.

Features

With regard to **Bank Details**, the following pushbuttons are available.

Pushbutton	Function
Mandates	There are no mandates yet for the business partner. You can create one or more mandates.
	You can change existing mandates.

Activities

To create mandates for a business partner:

1. On the SAP Easy Access screen, choose **Master Data** > **Business Partner** > **Change Payment Data**.
2. Enter a business partner and choose **Continue**.

   The system displays the payment data of the business partner.
3. If there is no IBAN, enter an IBAN or generate one using the pushbutton.
4. Choose the pushbutton.
5. Choose the pushbutton.

   The system automatically enters the data from the business partner on the **Payer** tab page, and the data from the company code on the **Payee** tab page.

   Subsequent changes to the address and bank data only result automatically in changes to the entries in the mandate if you have configured the synchronization accordingly in Customizing(see **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Management of SEPA Mandates** > **Enter General Specifications**).

   If you want to specify your own different default values, define event 0572. The system specifies the default value for the vendor ID in event 0571. If you want a different value, implement a customer-specific function module for event 0571.
6. On the **Basic Data** tab page, enter the status, validity and transaction type, along with the management data.

   By choosing the pushbutton, you can check the completeness of the data entered.

   You can use the , , and pushbuttons to print the data immediately or to print the data with the correspondence print run. For more detailed information about the options, see SEPA Direct Debits.
7. Choose **Continue**.

   The initial screen of the transaction appears. The system initializes the business partner data.

To change mandates for a business partner:

1. On the SAP Easy Access screen, choose **Master Data** > **Business Partner** > **Change Payment Data**.
2. Enter a business partner and choose **Continue**.

   The system displays the payment data of the business partner.
3. Choose the

   The system selects the mandates that are assigned to the business partner and IBAN, and displays them in a dialog box.

If the system is not able to find any mandates, it opens a dialog box and asks you to create a mandate. To create a mandate, confirm the dialog box and proceed as described above.

4. Select the mandate you want to change by double-clicking.

5. Enter your changes and choose **Continue**.

In the same dialog box, you have the option of creating new mandates or creating them with a template. Choose either the  pushbutton or the pushbutton.

Creating and Changing Mandates in Mass Runs

Use

You can create or change a large number of mandates in a single step. On the SAP Easy Access screen, choose **Payments** > **SEPA Mandates** and then the transactions **Create in Mass Run** or **Change in Mass Run**.

Prerequisites

You specified the modifiable fields and made general settings in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Management of SEPA Mandates**.

Activities

Creating Mandates in Mass Runs

1. On the SAP Easy Access screen, choose **Payments** > **SEPA Mandates** > **Create in Mass Run**.

2. Enter a date and an ID that you can use to identify the run later.

3. Choose **Continue**.

4. On the **General Selections** tab page, limit the business partners, for whom you want to create mandates.

5. On the **Mandate Data** tab page, enter the specifications for the mandates you are creating, and choose a grouping variant.

   There is a grouping variant `One Mandate per Bank Details and Paying Company Code`. If you choose this grouping variant, then the system groups the contract accounts and contracts of the business partner (or the insurance object, in the case of the **Insurance** and **Public Sector Contract Accounts Receivable and Payable**) based on the bank details for incoming payments and the paying company code. The system creates a mandate for each group. The mandates created using this variant do not have any reference to contract accounts or contracts, and therefore they can be used for paying items of business partners, independently of contract accounts or contracts.

   If you choose the grouping variant `One Mandate per Contract Account/Contract`, then the system creates a mandate for each contract account and each contract of a business partner. The system then adds the contract account or contract as a reference in the mandate.

   With both variants, the system fills the business partner as the payer and the paying company code as the payee in the mandate.

   If you want the system to print the mandates automatically after they are created, then set the **Print Created Mandates** indicator.

   To reset the specifications in a field:

   a. Select the field to be changed.

b. Then choose pushbutton.

c. Double click on .

6. Schedule the program run. For more information, see Functions for Scheduling Program Runs.

Changing Mandates in Mass Runs

1. On the SAP Easy Access screen, choose Payments > SEPA Mandates > Change in Mass Run.
2. Enter a date and an ID that you can use to identify the run later.
3. Choose Continue.
4. On the General Selections tab page, limit the mandates you want to change by entering the business partner (payer), company code (payee) and the date of last use.
5. On the Fields to Be Changed tab page, enter the fields you want to change and the new values for these fields. Choose the Enter Values for Fields to Be Changed pushbutton.
6. In the resulting dialog box, expand the list of fields to be changed, and select by double-clicking those fields which you want to change. Or you can select the required fields for changing by choosing the pushbutton .
7. In the dialog box, enter the new values.

> **Note**
> If you select fields here, but do not enter a new value for them, the system does not change those fields later.

8. Once you have selected all the applicable fields and entered new values for them, choose the Copy Changes pushbutton.
9. Schedule the program run. For more information, see Functions for Scheduling Program Runs.

Evaluation of SEPA Mandates by the Payment Program

Use

The payment program evaluates SEPA payment methods when incoming and outgoing payments are created.

Prerequisites

You classified payment methods as SEPA payment methods in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Define Payment Methods. In addition, for each payment method affected, you set the SEPA Mandate indicator in the Necessary Specifications group box in the master record.

> **Note**
> For you to be able to classify a payment method as a SEPA payment method, you also have to set the IBAN and Swift Code indicators.

Features

If the payment program identifies a payment method as a SEPA payment method (for instance, in the item, master data, payment specification, or promise to pay), then the program checks if:

- An IBAN is entered in the bank data of the business partner
- There is an active, unlocked SEPA mandate for the IBAN for this combination of payer and payee
- The reference in the SEPA mandate is suitable for the payment currently being processed

  If more than one mandate qualifies, you can use event 0653 to determine which mandate is used.

If a mandate to be used for payment is already entered in the document or the contract account/contract, then the payment program checks and uses only that mandate (see Integration of SEPA Mandates in the Processes of Contract Accounts Receivable and Payable).

For payments that are processed using a SEPA payment method with a valid SEPA mandate, the system stores the GUID of the mandate that was used and additional mandate data in the header record of the payment.

In the standard system, the payment program sets the execution date for mandates used for the first time to 5 days, and for mandates used again to 2 days after the creation of the payment (local instrument code `CORE`).

You can also use the local instrument code `COR1` to submit the payment media (`SEPA DD`) to the bank one day before the execution date.

The formats `SEPA_CT` and `SEPA_DD` are available for creating payment media.

The system checks the validity of a mandate based on the execution date calculated for the payment.

ℹ Note

You can set the calculated execution date at event 0062 as the alternative posting date of the clearing document. To do this, either register function module `FKK_SAMPLE_0062_AUSFD` at event 0062 or implement your own logic.

Activities

For mandates that can be used for multiple payments, the system can record the number of uses. To activate this recording function, you have to specify the number of uses of a mandate that you want the payment program to record in the system. To do so, in Customizing for Contract Accounts Receivable and Payable, choose **Payments** > **Incoming/Outgoing Payment Creation** > **Management of SEPA Mandates** > **General Settings**. Make the entry in the **Number** field. If you enter this number in Customizing, then the system creates an entry for each posted payment document or payment order. This entry is stored in a management table, and you can display it later in the mandate.

In Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Management of SEPA Mandates** > **Determine Local Instrument Code and Lead Times**, you enter the rules used by the payment program to determine the local instrument code, the lead time, and the calendar to calculate the lead time.

→ Recommendation

You can influence the lead times in events 0661 and 0656 (see the documentation of function modules `FKK_SAMPLE_0661` and `FKK_SAMPLE_0656`). The system processes event 0656 after it evaluates this Customizing activity and event 0661 before it evaluates this activity.

When you start using the Customizing settings for `COR1`, we recommend that you do not perform any additional calculations for lead times in events 0661 and 0656.

If you use parallel runs for the payment run, it can be the case that payments for alternative payers cannot be paid, because the affected SEPA mandate is locked against processing. Using event 0661, you can repeat the payment process for these

alternative payers in a final round at the end of the last interval. For more information, see the documentation for the sample function module FKK_SAMPLE_0661 and in SAP Note 1985525.

SAP Notes 1867435, 1881111, and 1884024

Synchronization of Mandates with Address and Bank Data in Business Partner

Use

The mandate for a set of bank details stores the IBAN of these bank details. If the bank or other bank data is changed, then it becomes necessary to adjust the bank data in the mandate, since otherwise the payment run cannot find a mandate for the new IBAN.

Activities

You configure the synchronization of the bank data in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Management of SEPA Mandates** > **General Specifications** so that the system does one of the following if a bank is changed:

- Queries in dialog if it should synchronize the mandate

  If you select this option and change the bank data with immediate effect, the system sends a dialog box in which the processor can adjust existing mandates.

- Adjusts the mandate automatically (without query)

  If you select this option and change the bank data with immediate effect, the system adjusts all existing mandates.

- Creates a new mandate automatically (without query)

  If you select this option and change the bank data with immediate effect, the system creates the new mandates.

- Queries in dialog if it should synchronize the mandate and changes the mandate if there are future changes

  If you select this option and change the bank data with immediate effect, the system sends a dialog box in which the you can adjust existing mandates. If you change the bank data with future effect, the system adjusts all existing mandates.

If you select the option **Do Not Synchronize**, the system does not make any changes to existing mandates.

You can also control the automatic creation and changing of mandates in event 0576.

In addition, you can specify that the system:

- Sends a query when you enter a new set of bank details with an IBAN to ask if SEPA mandates should also be created for this new bank

- Reverses existing SEPA mandates when bank details are deleted

- Automatically creates a correspondence request for the automatically changed or created SEPA mandate after a bank is changed or a new bank is created

  You can print this correspondence request later in the correspondence print run on the SAP Easy Access screen under Periodic Processing > For Contract Accounts > Correspondence > Print.

  To print, you can use correspondence type 0047 with the sample application forms `FI_CA_MANDATE_SAMPLE_SF` and `FI_CA_MANDATE_SAMPLE_PDF`.

If direct debit pre-notifications are active in your system, you can specify in Customizing that when bank details are changed, the system informs you about open direct debit pre-notifications that possibly can no longer be used because of the change.

If a bank bill of exchange has an exchange date in the future, the system makes the changes to the bank details on this date. To do this, schedule the report `BUBDTTRANSMIT` daily. The system then automatically enters the IBAN of the new bank details in the affected SEPA mandates.

Integration of SEPA Mandates in the Processes of Contract Accounts Receivable and Payable

SEPA mandates are integrated in the following objects and processes in Contract Accounts Receivable and Payable:

Object/Process	Use
Business Partner Items in the FI-CA Document	In the business partner item, in addition to the alternative payer and the bank details, you can now also enter the SEPA mandate to be used when payment is made. If an alternative payer is defined in the contract account, the system offers the mandates of this alternative payer for selection. If you select a mandate, the system enters the mandate reference and also the alternative payer in the document item. The payment run evaluates these entries during payment. The mandate reference is taken into account by the BAPIs for posting, changing, and displaying FI-CA documents.
Document Display	The entry for the mandate is found in the document display on the Payment Data tab. You can also make changes there. If a change is made, the system writes a change document that you can display from the document display menu under Environment > Document Changes > Document Changes Executed. A short description of the entered mandate is displayed in the document display next to the mandate field. In addition, the system supports forward navigation by means of double-clicking to reach the detailed display of the mandate.
Mass Change of Documents	You can display and change the mandate references entered in the document item in the transaction for mass changes to documents on the SAP Easy Access screen under Document > Mass Change.
Contract Account	In the contract account, in addition to entering an alternative payer and the bank details to be used, you can also enter the SEPA mandate to be used. In this way, you can assign the same SEPA mandate to multiple contract accounts. When you assign a SEPA mandate in the contract account, the system shows a selection of

	all suitable mandates for the business partner. From this list, you can also change mandates or create new mandates.
Account Balance	You can show the mandate reference entered in the document in the account balance at item level. To do so, define a line layout variant in Customizing for Contract Accounts Receivable and Payable under Basic Functions > Account Balance Display > Define Line Layout Variants for Account Balance. In the account balance, items for which pre-notification has taken place are shown with  . You can also add other data for the pre-notification (such as the pre-notification number and execution date) in a line layout variant (for more information about the pre-notification, see below).
Installment Plans	You can enter the SEPA mandate to be used when you enter or change an installment plan. You can print the entered mandate reference in the installment plan letter. In this way, the installment plan letter with the mandate reference entered can act as a SEPA direct debit pre-notification.
Requests	In a similar way as for business partner items, you can also enter a mandate in requests. When the receivable from the request is posted, the system copies the mandate reference to the line item of the FI-CA document; the payment run takes the mandate into account accordingly. You can also change the mandate reference in the request.
Payment Specifications	In payment specifications, in addition to entering the payer and the bank details to be used, you can also enter the SEPA mandate to be used. When you are assigning a SEPA mandate, the system displays a list of all suitable mandates for the bank details of the payer. From this list, you can change mandates or create new mandates.
Promises to Pay	In promises to pay, you can enter payment details for each installment for the collection of the installment. In addition to the payer and the bank details, you can enter the mandate reference to be used. In correspondence for the promise to pay, you can also print the entered mandate reference.
Prepaid Accounts	In prepaid accounts, in addition to entering the bank details to be used, you can also enter the SEPA mandate to be used. When you are assigning a SEPA mandate, the system displays a list of all suitable mandates for the bank details. From this list, you can also change mandates or create new mandates.

SEPA mandates are also integrated in the following industry-specific objects:

Industry Component	Object	Use
Insurance	Insurance object	In the same way as in the contract account, you can enter the SEPA mandate to be used in insurance objects. In this way, you can assign multiple insurance objects to the same SEPA mandate. In the SEPA mandate itself, you can only enter one insurance object.

		During payment, the payment run evaluates all payment data (such as payment method and bank details) in combination with the mandate.
Insurance	Payment Plan Items	You can enter the SEPA mandate to be used in payment plan items. The system adopts the mandate in the business partner items of the posted FI-CA document.
Public Sector Contract Accounts Receivable and Payable	Contract Objects	In the same way as in the contract account, you can enter the SEPA mandate to be used in contract objects. In this way, you can assign multiple contract objects to the same SEPA mandate. In the SEPA mandate itself, you can only enter one contract object. During payment, the payment run evaluates all payment data (such as payment method and bank details) in combination with the mandate.

SEPA Mandates in Interfaces of Contract Accounts Receivable and Payable

The following BAPIs take the SEPA mandate reference into acccount:

- Contract Account (Object Type `CA_CONTACC`):
  - `BAPI_CTRACCONTRACTACCOUNT_CR1`
  - `BAPI_CTRACCONTRACTACCOUNT_CH1`
  - `BAPI_CTRACCONTRACTACCOUNT_GD1`
  - `BAPI_CTRACCONTRACTACCOUNT_SREP`
- Request (Object Type `CA_REQUEST`):
  - `BAPI_REQUEST_CR`
  - `BAPI_REQUEST_CH`
  - `BAPI_REQUEST_GD`
- Prepaid Account (Object Type `CA_PREPACC`)
  - `BAPI_CTRACPREPAIDACCOUNT_CREA`
  - `BAPI_CTRACPREPAIDACCOUNT_CHNG`
  - `BAPI_CTRACPREPAIDACCOUNT_GETD`
- Contract Object (Object Type `PS_OBJECT`):
  - `BAPI_CTRACPSOBJECT_CHANGE`
  - `BAPI_CTRACPSOBJECT_CREATE`

    - BAPI_CTRACPSOBJECT_DISPLAY

- Insurance Object (Object Type BUSISI007):
    - BAPI_INSOBJECT_CHANGE
    - BAPI_INSOBJECT_CREATE
    - BAPI_INSOBJECT_GETDETAIL
- BAPI_PPLAN_ITEM_CREATE for Payment Plan Item (Object Type BUSISI013):

Pre-Notification of SEPA Direct Debits

Use

The changeover of national collection procedures to the SEPA direct debit scheme requires, along with the use and management of SEPA mandates, that the business partner be notified in advance about the items to be collected and the mandate to be used must be named.

You can implement this pre-notification yourself on the invoice using the corresponding additions.

Example

You make a note for the customer of the following information on the invoice: “The invoice amount is collected via mandate M4711.”

However, this only provides a complete solution if there is only one mandate for the payer's bank details or if the correct mandate has already been determined from different mandates during invoice creation.

You have to check whether the mandate number determined in this case should also be entered in the line item so that the pre-notified mandate can also be used later in the payment run.

If SEPA direct debit pre-notifications are used as follows they can provide an alternative to using the invoice as a pre-notification.

Features

The SEPA direct debit pre-notification contains the date of collection, the creditor ID of the company collecting the money, and the mandate reference that is used at collection.

You can create and send the direct debit pre-notification as a separate letter (new correspondence type). As another alternative, you can create this letter in processes that cause invoices to be issued, and print the letter on the invoice. In any case, you have to ensure that you only collect items for which pre-notification has been sent. That is, only items that you have mentioned in correspondence with the customer. You also have to ensure that you collect the items with the mandate entered in the pre-notification.

In Contract Accounts Receivable and Payable, you specify at the mandate level if direct debit pre-notifications are possible. At the level of the paying company code, you can specify in which paying company codes direct debit pre-notifications can be created.

You can also specify for each payment method if a direct debit pre-notification is necessary before collection can take place.

During posting, you can specify that pre-notification is necessary for certain items. You can also change this setting when you make manual changes to documents.

Activities

To be able to create direct debit pre-notifications, make the necessary settings in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation in the following activities:

- Under Management of SEPA Mandates > Enter General Specifications, specify that SEPA direct debit pre-notifications can be created.

  In addition, you specify the number of days after the pre-notification date that the direct debit is still allowed to take place. A direct debit is not allowed for a date earlier than the pre-notification date. The system does not perform a direct debit for a collection date that is more than the defined number of tolerance days after the pre-notification date. Instead, this results in a payment exception in the payment run. In such cases, you have to reverse the pre-notification and create a new one with a new collection date.

- You specify the paying company codes in which SEPA direct debit pre-notifications can be created in the Define Specifications for Paying Company Code activity.

- In the Define Payment Methods activity, you specify the payment methods for which SEPA direct debit pre-notifications must be created.

  If the creation of a direct debit pre-notification is required, the system does not collect a receivable, unless a suitable direct debit pre-notification was previously created. If a direct debit pre-notification does not have to be created, the system collects the receivable, even if a suitable direct debit pre-notification was not previously created.

- In the Customizing activity Enter Number Ranges for Direct Debit Pre-Notifications (SEPA), define the number range to be used by the system to determine the mandate reference number.

  The number range is used in the standard system at event 0570. If your own implementation is active at event 0570 or if you have entered your own module in table SEPA_CUST to determine the mandate reference, these have priority.

  You specify whether you want to use this number range for each paying company code in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Define Specifications for Paying Company Code. Double-click the required company code and set the Use Number Range checkbox in the Specifications for Determining Mandate Reference group box.

More Information

SAP Note 1894342

Pre-Notification of SEPA Direct Debits

Use

If you do not print pre-notifications during the creation of invoices, you can use a separate pre-notification run to pre-notify customers of receivables.

Features

The pre-notification run performs the following steps, like the collection run (payment run) itself:

- Selection and grouping of items to be collected

- Selection of payment method and bank data

- Selection of the mandate to be used
- Creation of payment data (tables DPAYH, DPAYP) for pre-notification

The pre-notification run does not post any documents and does not create any payment orders. Instead it creates direct debit pre-notifications. The pre-notification run enters each pre-notification as a use in the given SEPA mandate.

The created direct debit pre-notification is displayed in the mandate on the **Use** tab. In this way, the direct debit pre-notifications that were created based on this mandate are also visible in the mandate.

For each direct debit pre-notification that is created from the pre-notification run, the system creates a correspondence entry with correspondence type 0048. You can print this correspondence on the SAP Easy Access screen under **Periodic Processing** > **For Contract Accounts** > **Correspondence** > **Print**. For printing this correspondence, SAP provides the sample application forms `FI_CA_PRENOT_SAMPLE_SF` and `FI_CA_PRENOT_SAMPLE_PDF`.

To obtain an overview of all direct debit pre-notifications, on the SAP Easy Access screen, choose **Payments** > **Payment Run** > **Overview of Direct Debit Pre-Notifications**.

Activities

1. On the SAP Easy Access screen, choose **Periodic Processing** > **For Contract Accounts** > **Direct Debit Pre-Notification (SEPA)**.
2. Enter a date and an ID that you can use to identify the run later.
3. On the **General Selections** tab, restrict the selection to the direct debit pre-notifications you want to pre-notify. Enter the payment methods for payment and the due dates of the items to be collected.
4. Schedule the program run. For more information, see Functions for Scheduling Program Runs.

More Information

Carrying Out Payment Runs

Influence on SEPA Direct Debit Pre-Notifications in Events

In the following events you can influence the processing of direct debit pre-notifications:

Event	Use
0061	At event 0061, you can specify, dependent on any document data, such as the main and subtransaction of the items to be posted, if pre-notification is necessary for these items. For more information, see the documentation for the sample function module `FKK_SAMPLE_0061`.
0600	At event 0060, you can specify, dependent on any fields of the business partner item (such as the main and subtransaction), if pre-notification is necessary for these items. For more information, see the documentation for the sample function module `FKK_SAMPLE_0600`.

0602	At event 0602, you can reduce the collection amount of a group of items, for which a SEPA direct debit notification was created. This is done by clearing the items with credit memos that are due. For more information, see the documentation for the sample function module FKK_SAMPLE_0602.
0657	You can add additional checks using event 0657. You can also use the event to change some data of pre-notifications when they are created. Event 0657 is processed before you save the direct debit pre-notification. For more information, see the documentation for the sample function module FKK_SAMPLE_0657.
0658	At event 0658, you can perform additional actions after saving a change to a pre-notification. For example, you can create correspondence to inform the customer of the change. For more information, see the documentation for the sample function module FKK_SAMPLE_0658.

Displaying and Changing SEPA Direct Debit Pre-Notifications

Use

You provide direct debit pre-notifications to your business partners in writing. You have to react to queries regarding individual pre-notified items. If you reverse a direct debit pre-notification, you have to send pre-notification again for all items that were pre-notified. If a customer raises an objection about individual items shortly before the collection date, you can remove these items from the direct debit pre-notification without having to reverse the entire pre-notification. In such cases, you have to change the affected direct debit pre-notifications.

You can display the direct debit pre-notifications created by the pre-notification run.

Features

You can remove items from a direct debit pre-notification. If items were removed by mistake from a direct debit pre-notification, you can add them back to the pre-notification. The system automatically adjusts the current amount of the pre-notification to reflect your changes.

ℹ Note

You can only remove items from a pre-notification that were posted in the currency of the pre-notification.

ℹ Note

There is a restriction on the items you can add to a pre-notification that has already been created. You can only add back items that were already contained in the pre-notification but that were removed. You can only add back items that were removed, if the items were not cleared in the meantime, they were not included in a payment order, and no other pre-notification was created for them.

The system indicates that items were removed by displaying the icon  for the items in the pre-notification display on the **Items** tab.

The pre-notification display shows the data of the direct debit pre-notification (such as business partner, date of collection, mandate to be used, bank data) as well as a list of the pre-notified items.

From the pre-notification display, choose the  pushbutton to display the correspondence of the pre-notification.

Activities

To display the direct debit pre-notifications created in the pre-notification run, on the SAP Easy Access screen, choose Payments > Payment Run > Display Direct Debit Pre-Notification.

To change the direct debit pre-notifications created in the pre-notification run, on the SAP Easy Access screen, choose Payments > Payment Run > Change Direct Debit Pre-Notification.

Reversal of SEPA Direct Debit Pre-Notifications

Use

It is **not** possible to reverse a document that contains a pre-notified business partner item - you have to reverse the pre-notification first.

Document changes or clearing of pre-notified items (except clearing by the subsequent collection run) are **not** possible. During the processing of open items, the system does not select pre-notified items.

Features

You can reverse SEPA direct debit pre-notifications either singly or in a mass run. For mass reversal, you can select using the run ID of the pre-notification run, so that you can reverse all pre-notifications that were created in one run.

You can also select open pre-notifications for which the payment run was executed too late, meaning that collection could not take place. To do this, you select all the open pre-notifications with a pre-notified execution date that lies so far in the past that the defined tolerance days are exceeded.

When you reverse a SEPA direct debit pre-notification, the system removes the indicator showing the item is “pre-notified”. The item is available again for document changes, clearing, and pre-notification.

When a pre-notification is reversed, the system deletes any correspondence entries not yet printed.

Activities

To reverse individual direct debit pre-notifications, on the SAP Easy Access screen, choose Payments > Payment Run > Reverse Direct Debit Pre-Notification.

For the mass run, on the SAP Easy Access screen, choose Payments > Payment Run > Mass Reversal of Direct Debit Pre-Notifications.

Treatment of Direct Debit Pre-Notifications in Payment Run

On the SAP Easy Access screen under Periodic Processing > For Contract Accounts > Payment Run, on the initial screen of the payment run (on the General Selections tab), you specify that direct debit pre-notifications are selected and processed. To do so, you set the Pre-Notified Items indicator and enter the execution date for the pre-notification.

ℹ Note

For more information about the date settings in the payment run, see SAP Note 1876823.

For test purposes, you can also enter the pre-notification number itself as a selection criterion.

The payment run then pays the items based on the pre-notification, that is, it groups the selected items by pre-notification number and does not allow any additional sub-grouping. The payment run either pays a group of pre-notified items completely or not at all. If the amount of the pre-notified items is not the same as the collection amount, the system generates payment exception 52 (**Direct Debit Pre-Notification with Different Amount**) and does not pay the item.

Partial payment of items from a pre-notification is not possible.

⚠ Caution

Particularly if you use free selections (restriction of dataset of open items to be selected), it could be the case that not all items of a pre-notification are selected. Therefore, you should not use free selections for pre-notified items in such a way that you exclude individual items from a pre-notification.

If at the time of collection, the IBAN of the bank details to be selected is not the same as the IBAN in the pre-notification, the system generates payment exception 56 (**Direct Debit Pre-Notification with Other Bank Account**) and does not pay the item.

If the execution date named in the pre-notification is exceeded by a greater number of days than is entered in the settings in Customizing for Contract Accounts Receivable and Payable, the system generates payment exception 55 (**Debit Memo Notification Used Too Late**) and does not pay the item.

In this case, either check the Customizing entry for the tolerance days or reverse the pre-notification in the mass run and create this again if necessary.

Document Reversal and Clearing Reset

It is not possible to reverse a document that contains open and already pre-notified business partner items. You first have to reverse the direct debit pre-notification. After that, you can reverse the receivables document.

When a pre-notified receivable is cleared (by the payment run), the data of the pre-notification is retained in the cleared receivable. If you then reverse this clearing document, the receivable again becomes open, and at the same time, the data of the pre-notification is removed from the receivable. The pre-notification that was used for the payment keeps the status “Used” and it cannot be used again. You need a new pre-notification for the receivable before you can collect it.

The behavior is similar for a clearing reset for the clearing document created by the payment run. The data from the pre-notification is removed from the receivable when it is open again. You need a new pre-notification for the receivable before you can collect it.

Payments by Payment Card

In the payment run, you can also pay open items with payment cards.

Prerequisites

For the payment of open items, you either:

- Entered the card data in the master data of the business partners, and in the payment data in the master records of the contract accounts, you referenced a card entered in the master data (similar to bank details for incoming payments)
- Entered the card data in the item in the document

> **Note**
>
> When you enter card data in the master data of the business partner, the system carries out a formal check to determine the validity of the card number (check digit procedure). There is, however, no authentication. There is also no authentication in the payment run.

Defined a payment card for one-time use on the receivable.

You entered the data of the payment card institute and check rules for cards in Customizing for SAP Business Partner under Cross Application Components > SAP - Business Partner > Basic Settings > Payment Cards.

You indicated at least one payment method as a payment method for payment cards see Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Incoming/Outgoing Payment Creation > Payment Method.

You made the required settings in Customizing for Contract Accounts Receivable and Payable under Business Transactions > Payments > Processing Incoming and Outgoing Payments > Payment Cards.

For online settlements, you executed the Prepare Parallel Processing for Payment Card Data activity (in Customizing for Contract Accounts Receivable and Payable under Program Enhancements > Prepared Enhancements) and thereby included the Subarea (KEYPP) in the payment card data table (DFKKOPKC).

Key Features

When receivables are paid with payment cards in the payment run, receivables due to the payment card institution arise. If the payment run has completed processing, you have to report and transfer the receivables arising to the instruction in a subsequent billing run.

On the SAP Easy Access screen under Periodic Processing > Data for Externals > Payment Card Organizations, you can use the following functions:

Function	Use
Settlement	The settlement of data from a payment run or items to payment card institutes. The program creates a file with the selected payments and transfers the items from the receivables account to the clearing account. You can repeat the settlement. Items to be settled are items in a receivables account (report account) still to be reported to a payment card institute. Settled items are items in the clearing account that have already been reported. This is the offsetting account for the incoming payment, so the balance of this account is then zero. See the report documentation for further information.
Parallel Settlement by Direct Call	Settlement parallel processing of payment card payments (as a mass activity) This settlement variant does not create a file. With customer-specific definition of event 1421 you can establish an online settlement with gaining results immediately (settlement was successful or not with a corresponding error message). In

Function	Use
	event 1421, the payments to be settled are grouped by payment card company, company code, agent ID, currency, and value date. This means that the event is called up individually for each one of these groups. The system stores any error messages that may occur. You can display error messages in the document display for the payment document. The mass activity can select payments with errors, in addition to the payments for settlement, that is, payments for which settlement failed during the last attempt. The system stores the results of the billing run in the existing log tables under the ID of the mass activity. The parallel processing object for this mass activity is the Subarea (KEYPP) field that you added to the payment card data table (DFKKOPKC) (see Prerequisites).
Display Data Media	Display of the contents of the generated data medium (only for billing by file)
List of Payments	List of payments that were billed
List of Bills	List of the invoices paid with the billed payments
List of Card Data	List of all business partners with card data

Using the function Delete Logs on the SAP Easy Access screen under Periodic Processing > Delete Data > Payment Card Settlement, you can delete old billing logs.

Activities

Payment run

In the selection parameters of the payment run, specify a payment method that is designated for processing receivables with payment cards. If necessary, you can restrict the selection to one payment card type and thus process each payment card type in a separate payment run; the payment method of the category Card Payment used is the same for every run. If the processing in a payment run takes place only for one specific payment card type, the program creates a corresponding message in the application log and a payment exception for contract accounts where other payment card types are defined.

A bank selection is not necessary for this payment method since there are no transfer postings to bank accounts. The payment program clears the open items and creates open items in the receivables account (reporting account) of the payment card institute.

Functions in Document Display

In the document display, you can display payment card data by choosing Extras > Payment Card Supplement.

Enhancements

Payment Medium

You can add the format of the payment media in the following events:

Event	Implication
1410	Payment cards: File Header

Event	Implication
1411	Payment cards: File payment
1412	Payment cards: Paid item file

Parallel Settlement by Direct Call

Transaction FPCS allows online billing with immediate return of the results (a message stating whether billing was successful or not) by means of customer-specific definition of the event 1421. In event 1421, the payments to be settled are grouped by payment card company, company code, agent ID, currency, and value date. This means that the event is called up individually for each one of these groups. The system stores any error messages. You can display error messages in the document display for the payment document. The mass activity can select payments with errors, in addition to the payments for settlement, that is, payments for which settlement failed during the last attempt.

Classification of unsettled payments: Containing errors without further processing

At event `1421` (parallel billing of payment cards), you can select payments in the field `FINAL_ERROR` as a permanently non-billable indicator. An attempt at processing again is not permitted using transaction `FPCS`, this means a repetition run for such items is not possible.

Automatic return posting of non-billable payments

After the last interval at event 1799 for payments that have been classified as irretrievable not for settlement, for example, because the credit card was stolen, creates a returns lot creation and posting. In the menu of the transaction `FPCS` under **Environment** > **Returns create** you can repeat the return posting for a run.

Charge posting for successfully billed payments

At event 1421 (parallel settlement of payment cards), you can return charges in the new field `CS_CCFAM` for successfully billed payments that were levied by the credit card institute for successful settlement. The system posts these charges to a separate expense account and deducts them automatically from the clearing account for the credit card company. In this way, the expected incoming payment from the credit card institute is reduced.

Exclusion of payments from processing

At event `1425`, you can specific exclude selected payments from further processing.

For more information see the documentation for the sample modules defined for the events specified in Customizing for Contract Accounts Receivable and Payable under **Program Enhancements** > **Define Customer-Specific Function Modules**.

Payment per Due Date

Prerequisites

You define that for the items to be paid, only one payment is to take place for each due date. You do this in the payment method in the **Contract Accounts Receivable and Payable** Implementation Guide under: **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Define Specifications for Paying Company Code**.

Features

With one payment per due date, you can guarantee that items with differing due dates are paid on the respective due date for data medium exchange. This means that only items that have the same due date are paid together.

In the company code-specific system settings for the payment method, you can define that **one** payment per due date is to be made for the items to be paid.

The common due date for the items to be paid is saved in the payment header record. You can reference to this date in data medium printing and in data medium exchange. For example, you can transfer an individual execution date for every payment to your house bank.

If the total of the items to be paid produces a credit balance that requires an outgoing payment, the affected items are added to the next due date.

Invoice	1000	Due	10.02.2000
Credit memo	500	Due	11.02.2000
Invoice	200	Due	11.02.2000
Invoice	700	Due	12.02.2000

Grouping according to due date leads to the following result:

Due date	Balance	Action
10.02.2000	1000	Payment can be made
11.02.2000	300-	Payment cannot be made
12.02.2000	700	Payment can be made

In this case, the items from 02/11/2000 are added to 02/12/2000 to produce the following payments:

Due date	Balance	Action
10.02.2000	1000	Payment can be made
12.02.2000	400	Payment can be made

Value Date and Account Determination

Use

Once the system has determined the payment method and the house bank account, it then uses the settings defined in Customizing to determine the number of days until value date calculation. The posting date of the payment document is then added to this figure to give the value date required by cash management and forecast (the date on which the bank account is debited or credited).

However, this does not apply to payment card processing.

The bank clearing account for the bank line in the payment document, or the reporting account in payment card processing, is determined automatically from the definitions made in Customizing.

Activities

You make the following settings in Customizing:

- Enter value dates in Customizing for Contract Accounts Receivable and Payable Business under **Transactions** > **Payments** > **Incoming/Outgoing Payment Processing** > **Define Specifications for Paying Company Code**.

  This specification does not apply to payment card processing, for which it is not possible to enter value days.

- Enter a bank clearing account for the bank line item in the payment document, if payment is not made through a payment card institute in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Define Accounts for Payment Program**).

- Enter a reporting account for payment card processing in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Payment Cards** > **Define Accounts for Payment Card Institute**).

Posting Payments and Providing Payment Data

Features

Provided the payment method is not marked as “internal clearing,” the payment program generates a bank line item, thereby clearing the open items. If the payment method is used to create a check, or it is a payment by payment card, the bank line items are transferred to the general ledger as separate line items and are not grouped. For each process started in parallel, the system creates a reconciliation key that can be used by this payment run only. If the payment method is marked as “internal clearing,” the payment program does not generate a bank line item for clearing. Instead, each industry component must use event 0620 to create an item that clears open items. Payment method “internal clearing” should be used if the amounts due are to be debited or credited to a deposit account.When you post the clearing documents, the exchange rate differences are posted automatically. For the bank posting, the amount in local currency is given by the translation of the foreign currency amount using the current exchange rate.The data required about the payment for creating payment media is marked as payment data and stored in a separate table. You use this data for further evaluation using the payment list and it forms the basis of the payment program. You can use Events 0630 (payment) and 0640 (paid items) to add additional information to this data.To do this, provide installation-specific function modules for these events in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Program Enhancements** > **Define Customer-Specific Function Modules**.

Carrying Out Payment Runs

To execute a payment run, choose one of the following paths:

- **Role**: **Debit Memos and Payment Run (SAP_FI_CA_DEBMEMOS_PAYMENTRUN)** > **Process and Start Payment Run**
- **SAP Easy Access screen**: **Periodic Processing** > **For Contract Accounts** > **Payment Run**

Then perform the following steps:

- Editing Payment Run Parameters

  You can use an existing payment run as a template and perform a simulation run (see Simulation Runs).

- Scheduling Payment Runs (See also Functions for Scheduling Program Runs)

Once you have executed the payment run, you can display logs and payment lists.

The program does not process business partners and contract accounts, for which locks exist during the program run due to dialog processing. Using event 0661, you can have the system reprocess locked business partners and contract accounts after the program is finished running. If you activate this function in event 0661, then, depending on whether you choose the “Business Partner” or “Contract Account” as the parallelization object, the program records all business partners or contract accounts that could not be processed. The job that processes the last interval (this does not have to be the interval with the highest number) attempts to process the locked business partners or contract accounts again. This takes place during the final round of processing after the last interval has been processed. If the reason for the lock no longer exists at that time, these business partners or contract accounts are processed, and therefore there is no need to schedule the run again. For more information, see the documentation for the function module FKK_SAMPLE_0661.

Editing Payment Run Parameters

Prerequisites

Before you can schedule and execute a payment run, you have to enter the parameters to be used to select items for payment.

In Customizing for **Contract Accounts Receivable and Payable** , you have defined bank selections. In these bank selections, you can define which bank the payment program uses for making payments for each company code, payment method, and currency. (Choose **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Maintain Bank Selection.**)

If you want to use preselections for master data, then you created selections on the SAP Easy Access screen under **Technical Preparation** > **Define Preselections** (see Defining Preselections for Master Data). For example, you can define a set of master data using master data attributes, such as, all business partners with a given city in their address.

Procedure

1. Enter a date and an ID that you can use to identify the run later.
2. Choose **Continue.**

   On the **General Selections** tab, enter the parameters, the payment methods, and the due-by date. The program uses these criteria to select the open items.

   For selecting business partners or contract accounts, you can also use preselections for master data. Using these preselections, the system checks the specified master records against the interval limits of the mass activity, as if they were entered as individual values for the business partner/contract account. In each interval, therefore, the system processes only those master records that are both within the interval limits and are part of the preselection.

   To switch back and forth between direct selection and preselection, choose the pushbuttons **Direct Selection** (**Switch to Direct Selection**) and **Preselection** (**Switch to Preselection**) next to the input fields for the business partner and contract account.

   In the field **Posting Date** , enter the date on which the clearing document is to be posted.

   The system automatically creates a reconciliation key for the data transfer to the general ledger for each job.

   If you want to use the data of an existing payment run as a template, you can copy the parameters of this run. Specify the date and ID of the template and choose **Program Run** > **Copy** . Enter an ID for the copy and choose **Continue** .

   If you want to simulate the run for test purposes, set the indicator **Simulation Run** .
3. Choose the **Custom Selections** tab to restrict the selection of open items even further.
4. Choose the **Bank Selection** tab, and define the relevant banks for all the payment methods you want in this payment run for each company code and currency. In the field **Sequence** , you can define the order in which the system is to check whether the payment can be made by the individual banks. If you do not want to enter the bank selections for each

payment run explicitly, you can enter a bank selection ID in the **Selection ID** field. However, you must have already defined this ID in Customizing (see above).

You can define a customer-specific evaluation of the sequence in event 0650. See the documentation for the sample function module FKK_SAMPLE_0650.

For more information, see Functions when Scheduling Program Runs .

5. Save your entries and schedule the program run.

To make the settings for the payment media required, choose **Goto** > **Payment Media** . For more information about creating payment media, see Creating Payment Media for Bank Collections .

Scheduling Payment Runs

Prerequisites

You have entered the payment run parameters . The settings for parallelization (simultaneous runs) are particularly important.

Procedure

1. On the payment run initial screen, choose **Schedule Program Run** .
2. The initial screen for scheduling the job appears. If you have already carried out a test run, the system deletes the payment data before you reschedule the run.
3. Enter the start date and time or execute the payment run immediately.
4. If you chose **Start Immediately** , the job is started. Use **Refresh** to monitor the status of the job.
5. If you have maintained the corresponding variants in the parameters, the payment media is created after the payment run. You can also schedule the creation of the payment media for later from the selection screen of the payment program. Choose **Environment** > **Payment Media** > .

For more information, see Functions for Scheduling Program Runs (451) .

Displaying logs and payment lists

Prerequisites

In parameter maintenance for the payment run on the **Logs** tab page, you selected the required additional logs.

You have executed a payment run either in a simulation run, update run, or production run.

Procedure

On the initial screen for the **Payment Run** transaction, enter the date ID and identification of the required payment run and choose **Continue** .

On the **Logs** tab page, you can now use the buttons **Job Logs** and **Application Logs** . The application log displays all commercial information from the application perspective, and the job log displays all technical information for the individual jobs.

If you selected the relevant indicators on the Logs tab page before scheduling and executing the payment run, the following information is also displayed:

Indicator	Information displayed in the log
Short log	Amounts due and payment locks
Items that can be cleared	Items to be cleared
Payment method selection in each case	Log of payment method selection
Payment method selection if not successful	Log of payment method selection if the payment program could not select a payment method.

Choose Environment > Payment List to display a list of the payment exceptions and all items paid.

On the List of Payment Data screen, you can set the relevant indicator in the General Selections area to determine whether the list displays only payments, only exceptions, or both.

In the Display Variants area, you can select the required variant for the totals list or the line item list. If you execute the Payment List with the parameter Maintenance Mode, you can define these variants and save them under a key of your choice.

You can also restrict the number of payment exceptions output by including the corresponding item indicator in Customizing in the list of item indicators that you want the system to ignore. In Customizing for Contract Accounts Receivable and Payable, choose: Business Transactions > Payments > Incoming / Outgoing Payment Creation > Define Scope of Exception List. The item indicators entered here do not appear in the list of payment exceptions. Instead, they are treated as if the business partner is a self-payer and the item is not paid automatically. This enables you to reduce the size of the payment list considerably. This setting is particularly useful for payment exceptions that occur because you have specified only one payment method in the current payment run, and therefore the accounts for which other payment methods apply cannot be paid.

The payment run checks whether the selected open items can be paid. If an item cannot be paid, the first failed check determines which error message appear in the exception list, which the error message is to appear in the application log and which exception reason is stored in the payment data. The sequence of the criteria according to which an open item is checked is fixed in the program.

For more information, see Functions for Scheduling Program Runs.

Simulation Runs

Simulation of a payment run covers the following program steps:

- Selection of open items
- Grouping
- Determination of payment methods
- Determination of house bank(s)
- Document creation checks

The payment data is saved. So that the test run can be repeated however, no payment documents are created. A test run is therefore more for analysis purposes, and can be performed during the test phase for example, to check your Customizing.

To start a payment run in simulation mode, set the indicator **Simulation Run** on the tab **General Selections** in the transaction **Payment Run** .

You can change the parameters of a simulation run that has already been executed at any time and then start the run again.

Using Payment Orders

Use

Payment orders can be created with automatic payment transactions for debit memo procedures and with bank transfers. A payment order is created if the payment is made, but if the posting is only to take place in the system when the payment appears on the house bank account statement. A payment order is created and the transfer order is transferred to the bank via DME.

Payment orders have the following advantages:

- You can post using the bank exchange rate for payments in a foreign currency. In contrast, if foreign currency payments are posted using the payment program, only those exchange rates defined in Customizing are used.
- If the execution date for a payment order is in the future, the item is only cleared when payment has taken place. This leads to a precise display of open items on the key date.
- If taxes are to be deducted at the time of payment, the tax report is not created at the time of the payment run, but only after the payment has been posted by the bank.

Integration

When you **change documents**, the system treats open items in a payment order as cleared items.

Prerequisites

You have defined default values for payment order lots in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Processing Incoming and Outgoing Payments** .

To enable selection according to the payment order number in the payment order lot, you have defined a selection criterion that refers to the **Payment Order** field (PYORD). The system delivery contains 10 number ranges preset for payment orders with local buffering. These number ranges enable easy parallel running for payment runs.

Number Range	Interval
00	0000000001 – 09999999999
01	1000000000 – 19999999999
...	
09	9000000000 – 99999999999

You need to take action only if these number ranges have not been correctly set up, or if they contain errors, or if you want to increase the amount of number ranges in the case of intensive use of parallel processing. In that case, process the number ranges in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Processing Incoming and Outgoing Payments** > **Check Number Ranges for Payment Orders** .

You have activated partial clearing for payment orders in Customizing for Contract Accounts Receivable and Payable under Basic Functions > Postings and Documents > Basic Settings > > Maintain Central Posting Settings > by setting the Partial Clearing for Payment Orders indicator.

Features

The payment program can create payment orders instead of posting a payment document. The items within a payment order are marked for the period between the execution of the payment run and the processing of the account statement such that payment using a new payment run is prevented, and so that other clearing transactions, reversal, dunning, and overdue interest calculation are not possible.

Payment orders consist of header data and item data. The paying company code, the payment amount, the payment method, the house bank account and other payment-relevant information are stored in the header data. A separate record is created in the item data for every paid line item. In addition to the line item key, this record contains the gross amount, the deduction for cash discount and the withholding tax amount. You can enter payment orders in different currencies and with different exchange rates in one payment order lot.

Every payment order automatically receives a number that is unique within a client. The number for the payment order is retained on the payment form in the data medium. This number takes the place of the payment document number that is recorded during immediate posting of the payment by the payment program.

The number for the payment order is also recorded in the account statement of the house bank. This enables you to quickly and clearly select paid items.

The payment orders reported in the account statement are collected in a **payment order lot**. This is comparable to a payment lot (for incoming bank transfers, for example). You can create payment order lots manually as well as automatically. Each executed payment order creates an item in the payment order lot. Each item contains the payment amount and the payment order number.

If the associated open items were cleared when posting the payment order lot, the payment order is marked as complete.

Even if the payment amount is less than the amount entered in the payment order, you can process the payment order lot automatically.

However, the following limitations apply for the **automatic partial clearing of payment orders**:

- The system is only allowed to distribute the payment amount to the items contained in the payment order.
- You have configured clearing control, so that no new items on account are created due to a partial clearing.
- The system can only process partial payments, not overpayments.
- The payment document of a partially cleared payment order is only allowed to be reversed using reversal method 1 by new offsetting items. The payment order itself remains unchanged when this type of reversal is used.

  ### ⓘ Note

  After the reversal, you have to create a new payment order, in which you include both the new offsetting items created by reversal method 1 and the items of the original payment order that have not yet been cleared.

The system distributes the payment amount based on the rules entered in clearing control on the items belonging to the payment order. The payment order itself receives the status Executed.

If you display a partially paid payment order (in transaction FP0R3 in the SAP Easy Access screen under Payments > Payment Run >), the system displays the actual payment amount.

Activities

To create payment orders, define the payment method on the contract account, in the contract, or in the document on the Payments/Taxes tab.

Processing Payment Orders

⚠ Caution

You cannot delete payment data from a payment run for which open payment orders still exist.

Payment orders are created automatically by the payment program. You can use the following functions for postprocessing:

Function	Procedure
Display Payment Order	1. Choose one of the following paths: • **Role** SAP_FI_CA_DEBMEMOS_PAYMENTRUN: Debit Memos and Payment Run > Display Payment Order • **SAP Easy Access screen**: Payments > Payment Run > Display Payment Order 2. Enter the number of the payment order and choose Continue. The header data for the payment order is displayed on the subsequent screen.
Setting the expiration date in payment orders	In event 0696 you can set an expiration date in payment orders. Use the report RFKKPY0R_REF to include expired payment orders to a returns lot.
Change Payment Order	1. Choose one of the following paths: • **Role** SAP_FI_CA_DEBMEMOS_PAYMENTRUN: Debit Memos and Payment Run > Change Payment Order • **SAP Easy Access screen**: Payments > Payment Run > Change Payment Order 2. Enter the number of the payment order and choose Continue. You can change the expiration date for the payment order on the subsequent screen.
Reverse Payment Order	1. Choose one of the following paths: • **Role** SAP_FI_CA_DEBMEMOS_PAYMENTRUN: Debit Memos and Payment Run > Reverse Payment Order • **SAP Easy Access screen**: Payments > Payment Run > Reverse Payment Order 2. Enter the number of the payment order and choose Save. The payment order is reversed. **ℹ Note**

	In order to be able to reverse payment orders, you have to have authorization for activity 85 in authorization object F_KKK0_BUK. The payment order is not allowed to already be **reversed**, **expired** or **executed**.
Displaying an Overview of Payment Orders	1. Choose one of the following paths: ○ **Role** SAP_FI_CA_DEBMEMOS_PAYMENTRUN: **Debit Memos and Payment Run** > **Overview of Payment Orders** ○ **SAP Easy Access screen**: **Payments** > **Payment Run** > **Overview of Payment Orders** 2. Select the payment orders according to the following criteria: ○ **Bank data** ○ Status of the payment order(s) ○ **Payment run** used to create the payment orders ○ **Payment order** ○ Entered by 3. Choose **Execute**. The list contains the header data for all the payment orders that match the criteria. In this way, you can display the payment orders that should already have been executed, and the payment orders for a certain payment run, for example.
Delete Payment Orders	1. Choose one of the following paths: ○ **Role** SAP_FI_CA_ARCHIVING: **Archiving** > **Delete Payment Orders** ○ **SAP Easy Access screen**: **Periodic Processing** > **Archive Data** > **Payment Orders** 2. Enter the relevant parameters and set the **Detail List** indicator in the processing options to display the payment orders, or choose **Update Run** to delete them directly. 3. Choose **Continue**. **ⓘ Note** Only delete payment orders where the execution date is at least 30 days in the past, and the status is **Executed**, **Reversed**, or **Expired**. Explicit deletion of payment orders only makes sense if no forms or data media have been sent, or if they have been recalled.

ⓘ Note

To post returns for payment orders, set the **Extended Returns Processing** indicator in the header of the returns lot. The posting is then carried out automatically (see also Entering Returns Lots Manually). The system posts a clearing document that it then reverses immediately. The original receivable in the contract account of the business partner is therefore open again and the payment order has been reversed.

Mass Reversal of Payment Orders

Use

You can use the report Mass Reversal of Payment Orders to reverse payment orders for a payment run that were created incorrectly.

Prerequisites

You have not transferred the payment orders to your house bank yet and the payment orders have not been reversed or have not expired.

Features

In an update run, the program designates the payment orders as reversed. The original receivables in the contract accounts of the business partner are then open again.

Activities

1. Restrict the selection of payment orders, by the following:
    - The ID or run date of the payment run that generated the payment orders
    - The bank data of the payment orders created
    - The business partner for which the run created payment orders, either by payment order number or time of entry
2. Choose  .

If you do not set the **Update Run** indicator, the program runs in test mode.

If you set the **Detail List** indicator, all of the reversible (test run) or reversed (update run) payment orders that meet the selection criteria are displayed.

Note

To be able to reverse payment orders, you have to have authorization for activity 85 for authorization object F_KKK0_BUK.

Clarification Processing (Payment Program)

Use

Payment exceptions are automatically included in the clarification worklist. By branching from the worklist to the document or the contract account, you can determine whether the exception is correct. You may have to reset locks; in this case the items in question would be processed and possibly paid in the next payment run.

An error level (for example, contract account or document) is determined for each exception. One entry is written in the clarification worklist for each error level.

Example

If there is a lock in a contract account and it prevents ten items from being paid out, there are ten exceptions in the payment list but only one entry in the clarification worklist since the error level in this case is "contract account" and can be removed by a change to the contract account.

Prerequisites

In order for a payment exception to be included in the clarification worklist, the item indicator must be marked as "to be clarified". If a lock reason has been set, this lock reason must also be set to "to be clarified". In Customizing, select the item indicators and payment lock reasons accordingly (see IMG structure **Contract Accounts Receivable and Payable** > **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Select Item Indicator for the Clarification Worklist** > **or** Define Payment Lock Reasons).

Features

For clarification worklist processing, you can assign a clerk to individual cases for clarification in Customizing using the role definition feature (similar to SAP workflow). This accounting clerk then receives only those clarification cases within his/her worklist for which he/she is responsible within the organizational structure linked to the role. The system evaluates the units of your organizational structure to determine the clarification cases needing processing. For more information about role definition in SAP Workflow, see Role Definition . For more information about organizational structures and preparatory activities, see Organizational Structures

Clerks can restrict the selection of clarification cases for processing using selection criteria. One way of doing this would be to enter a company code when calling the function for clarification processing. The fields that are displayed on the selection screen for selection items are defined in Customizing. (See IMG structure in Contract Accounts Receivable and Payable **Technical Settings** > **Prepare Processing of Clarification Worklist**).

Clarification items can be processed by several accounting clerks at once. When viewing the clarification worklist, items can be reserved for a particular clerk, thereby preventing them from being processed by other clerks. A clerk may also choose to cancel this reservation. You can also impose a time limits on locks in Customizing. After the lock interval has expired, the clarification cases can be accessed by all clerks.

To refresh the clarification worklist you can either:

- Refresh the status information (this only updates the status of the individual clarification cases). You can now see which clarification cases were locked or clarified by other accounting clerks since the previous update.
- Reselect the list: The system reselects items in line with the selection criteria you entered on the selection screen when you first called up the list. If you choose reselection, those items that have been clarified or locked by other users no longer appear.

You can display a detailed overview containing the attributes of each clarification case. If you activated use of notes for clarification cases in Customizing, the system now displays notes for the clarification case. If the clarification case was locked by a user, you can add your own notes to it.

You can use the **Urgent Clarification Cases Only** function on the selection screen for incoming payment clarification. This ensures that only those clarification cases that require immediate processing are displayed.

You can define the specifications for the urgency of a clarification case in the system settings (**Contract Accounts Receivable and Payable Implementation Guide** under: **Technical Settings** > **Prepare Processing of Clarification Worklist**).

A MiniApp is available in the mySAP.com Workplace for displaying urgent clarification cases. This means that when you log on to the system, you immediately get an overview of the urgent clarification cases. You can then use this MiniApp to go directly to the clarification worklist for the urgent clarification cases.

Clarify Payment Exceptions

For the clarification of payment exceptions, two transactions are available — transaction FPCPR (selection from list and processing in full screen) and transaction FPCPRN (processing in split screen).

Clarification Exceptions (New) (transaction FPCPRN)

1. In the SAP Easy Access menu, choose Payments > Payment Run > Clarification Exceptions (New)

   The initial screen for clarification processing appears. You can display the list of payment exceptions to be clarified as follows:

   - Administrator Mode

     If you choose Administrator Mode pushbutton and have the required authorization, you can display all payment exceptions that are still to be clarified or that have been clarified in the system.

   - Resubmission Cases

     If you choose the Resubmission Cases pushbutton, all payment exceptions are displayed in the list for which you previously selected Resubmission On on the Overview tab page in clarification processing.

   - Workflow Cases

     If you choose the Workflow Cases pushbutton, the list displays all payment exceptions that are currently in a workflow process.

   - Clarification list according to selection

     If you fill the required fields in the selection screen in the initial screen for clarification processing and choose Execute, the clarification list only contain the payment exceptions that meet these requirements.

     If you do not enter any restrictions, and choose Execute, the list displays all payment exceptions that are free or have been assigned to you for processing.

     If you select field names in the tree structure, and then choose the pushbutton Apply Selected Entries, you can add fields to the selection screen. If you choose Delete Selected Entries, you can remove fields from the selection screen.

     The system displays a list of payment exceptions to be clarified.

2. Select the item you want and choose Edit > Clarify.

   The detail view of the payment exceptions to be clarified, resulting from item indicators or locks in the contract account or line item, opens.

   Details of the document, contract account, partner balance or account, and business partner data are listed on tab pages. This lets you check if locks were set correctly, and undo the lock if required.

3. If an item indicator was the reason for the lock, there are different possibilities for proceeding, depending on the item indicator:

   - If payment could not be made because of missing system settings, for example, because no G/L account for cash discount was defined, you can enter the relevant Customizing settings in an alternative mode.

   - If a debit balance prevented payment of an item, you could, for example, lock the account item for a limited time to achieve payment.

4. Only set the status to Completed (function key Clarification Successful in the header of the processing screen) if you could clarify the following:

Clarification of Payment Exceptions (transaction FPCPR)

1. Choose one of the following paths:

   - **Role**:

     Debit Memos and Payment Run (SAP_FI_CA_DEBMEMOS_PAYMENTRUN) > Clarification Processing Payment Exceptions

   - **SAP Easy Access menu**:

     Payments > Payment Run > Clarification Exceptions

2. The screen for processing the clarification worklist is displayed.

   The clarification worklist is displayed on the left-hand side. You can select individual views by switching between the various tab pages. In this way, you can display all clarification cases, or only the clarification cases you are processing, in a list.

3. Place the cursor on the clarification case worklist item you want, and press the **Clarify** pushbutton.

   The detail view of the payment exceptions to be clarified, resulting from item indicators or locks in the contract account or line item, is displayed in tab pages on the right-hand side of the screen. You can refer to the details of the document, contract account, partner balance or account, and business partner data there. This lets you check if locks were set correctly, and undo the lock if required.

4. If an item indicator was the reason for the lock, there are different possibilities for proceeding, depending on the item indicator:

   - If payment could not be made because of missing system settings, for example, because no G/L account for cash discount was defined, you can enter the relevant Customizing settings in an alternative mode.
   - If a debit balance prevented payment of an item, you could, for example, lock the account item for a limited time to achieve payment.

5. Only set the status to **Completed** (function key **Clarification Successful** in the header of the processing screen) if you could clarify the following:

   - The clarification worklist item

     Otherwise, stop processing or select another clarification case.

   - Whether item indicators or locks were set correctly, or if you have released the lock

If you want to use the view urgent clarification cases, you can define a workflow role that has previously been created for the application object in **Role for Displaying Urgent Clarification Cases**.in the system settings for Contract Accounts Receivable and Payable under Technical Settings > Prepare Processing of Clarification Worklist. This defines which criteria apply for the specific user groups, so that a clarification case can be classed as urgent.

In the same way as for clarification of incoming payments that were posted in payment lots, you can also search for payments that were created by the payment run. You can use this function for returns, for example, if only bank data and amount are recognizable, but the business partner can no longer be determined by an incomplete entry in the note to payee. In the SAP Easy Access menu, choose Payments > Payment Run > Find Payment.

Administrator Function

Creating Payment Media

Use

You create payment media if:

- You want to transfer the data required for electronic payment transactions with banks in the form of a data medium
- You want to issue checks

Integration

In **Contract Accounts Receivable and Payable** , you create payment media in the payment program.

Prerequisites

See SAP note 533686 for the settings in the note to payee.

Features

For each successfully executed payment run, the system creates one or more payment media.

Activities

1. In the payment run transaction, choose **Environment** **Payment Media** .
2. In the corresponding fields, define a variant for each of the payment media to be created or for the payment list. Use the input help.
3. Save your entries.

To create your own variant for creating payment media, proceed as follows:

1. In the field **Payment Medium Variant** , enter the name of the variant that you wish to create.
2. Place the cursor on the variant name and choose **Variant** **Maintain Variant.**
3. Maintain the settings for screen assignment and choose **Continue** .
4. On the subsequent screen, define the required payment medium format.
5. In the **Print Control area** , set the indicator **Data Medium Exchange** to maintain the print parameters for the accompanying sheet, and the indicator **Error Log** to maintain the print parameters for the error log.
6. In the **Output Control** area, you can define the following settings:
    - **File Name** : Name of the DME file if you output this in a file system of the application server. However, this output only takes place if you have set the indicator **Output in File System** .
    - **Form Accompanying Sheet DME** : Here you can define a different SAPscript form for the payment media format to the one defined in the system settings if you want to create an accompanying sheet for a DME file (see the Implementation Guide for **Contract Accounts Receivable and Payable, Business Transactions** **Payments** **Incoming/Outgoing Payment Creation** **Define Specifications for Paying Company Code (Payment Media Formats in Company Code**)).
    - You can also define the use of the ISO code for currencies.
    - If you set the indicator **Texts in Recipient Language** , the information forwarded to the bank for the customer account statement is output in the language defined in the business partner master record.
7. Choose the button **Attribute** and enter the required meaning.

8. Save your entries.

In event 0699, you can start your own program/workflows or output additional logs once you have created the payment media. This event is processed once all payment media jobs started have been completed.

Using report RFKKPAYMJOBC you can get a current overview of the status of the payment media jobs and display job logs.

Special Features of the Format DTAUS0 for Germany

When you create the payment media, the system enters a value in the field **Run Date** ; depending on the due date of the cleared items, this can also be in the future. However, if the data media is to be executed by the bank immediately, leave the field blank. To do this, set the indicator **Execute Immediately** in the variant in the **format parameters** .

In the definition of the format, in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Define Specifications for Paying Company Code (Payment Media Formats in Company Code),** you can specify that the files are to be created in parallel. You can also specify a minimum number of payments within a payment group – grouping of payments by bank details and payment method by the payment program – from which parallel processing is to take place. This enables you to prevent smaller payment runs creating several files, each with very little payment data. If a payment group fulfills the minimum requirement, you still cannot predict what size the individual files will be.

Correspondence Banks

If you use payment media formats that consider correspondence banks, such as formats from EDIFACT, S.W.I.F.T (MT 100, 101, 103, 104, 200, and 202), or your own developments, for transfers from one bank to another, in Customizing, you can define a bank chain with up to three interim banks, the correspondence banks. You can define general and recipient-specific bank chains. You have to specify recipient-specific bank changes in the master data of the business partner on the tab page **Payment Transactions** in the area **Bank Chains** .

The function module FI_PAYMENT_BANK_CHAIN_SET determines the bank chains during the payment media creation and places them in the corresponding structures. If you want to use the function for the payment media formats stated, you have to add the call of the function module FI_PAYMENT_BANK_CHAIN_SET to the function modules defined for the events 0020 and 0030, or, for customer-defined developments, the events 0021 and 0031. The function module FI_PAYMENT_BANK_CHAIN_SET contains the data in the corresponding event module as import parameter.

You make the system settings for bank chains in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Basic Functions** > **Bank Chains.** .In the activity **Define Scenario** , you define for each scenario, whether the bank chain is determined via the general bank chain search and/or via the partner-specific bank chain search. If both fields are set, the partner-specific bank chain search has priority over the general bank chain search. Using the fields **Sender Bank, Recipient Bank Country, Recipient Bank** , and **Currency** , you can define a ranking for the bank chain search for each scenario. SAP delivers four standard scenarios; you can also generate your own scenarios.The bank chains that you create in the activity **Set Up General Bank Chains** are independent of the bank details of a business partner or of the house banks. For a bank chain ID, you can create up to three intermediary banks. The intermediary banks are linked independently of the recipient and sender banks.

Forms and Payment Medium Formats

The payment medium formats in the table are delivered by SAP. If any formats are missing, contact SAP.

The system settings required for the creation of payment media are made in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Creation of Incoming / Outgoing Payments** > **Payment Media** .

To forward instructions for the execution of payment orders to the participating banks, you can define instruction keys under: **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** .

Country	Format	Country	Format
Australia	BECS	**New Zealand**	MTS
Belgium	DOM80PIBDTA	**Netherlands**	CLIEOP03
Brazil	bar code (incoming payments) direct debit (debit memo) for incoming and outgoing payments	**Austria**	AT_DOMV3V3A

Print Individual Outgoing Checks

Use

You can print individual checks for outgoing payments directly online. Application form `FI_CA_DME_CHECK_SAMPLE` is used as a template for a check form with cover letter. You can define a separate check form for each house bank account in Customizing for Contract Accounts Receivable and Payable under **Business Transactions** > **Payments** > **Incoming/Outgoing Payment Creation** > **Settings for Check Creation**.

Prerequisites

To determine the bank data, the check clearing account used in the payment document must be defined in Customizing and the **Valid for Online Check Printing** indicator must be set. If you set the indicator, the respective clearing account can be used in online check printing.

In Customizing for Contract Accounts Receivable and Payable, choose **Business Transactions** > **Payments** > **Processing Incoming and Outgoing Payments** > **Define Bank Clearing Accounts for Payment Lots**.

Procedure

1. From the SAP Easy Access screen, choose **Payments** > **Online Check Printing**.
2. Enter the document number of the payment document and choose **Continue**.

   The data for the business partner, contract account, and contract, as well as the amount, house bank, and account ID are filled automatically.

   If the document contains postings to multiple business partners, a dialog box appears. There you can select the business partner to whom the payment is to be made.
3. Specify an note to payee and a check number

   The text entered in the **Note to Payee Text** field replaces the individual texts in the cleared item.

   If you do not specify a check number, the number of the payment document is automatically used as the check number.
4. Choose **Document** > **Print Check**.

   If you have defined multiple payment methods for checks in the system settings, a dialog box appears in which you must select the appropriate payment method.

   You can also print checks for outgoing payments with the function Payment at Cash Desk.

   On the SAP Easy Access screen, choose **Payments** > **Cash Desk** > **Payment at Cash Desk**
5. On the **Payment Specifications** tab page, select the **Outgoing Check Payment** radio button and set the **Print Check** indicator.

   When you post the outgoing payment, a check is created automatically.

Result

The check was printed. The checks for the document are managed in the check repository with the check numbers used.

If you try to print a check for the same payment document, a replacement check with a new check number is created in the check repository.

Check Management

Use

You use check management to enter and process outgoing checks.

Features

You can use check management to carry out the following for checks:

- Enter a check
- Display a check
- Find a check
- Correct a check
- Void a check
- Delete a check
- Replace a check
- Register a check as cashed
- Assign a check to a payment document

Activities

To work with Check Management, choose one of the following paths:

Roles

Check Management > (SAP_FI_CA_CHECK_MANAGEMENT) > Check Management

SAP Menu

Payments > Check Management

Check Number Assignment

Use

In Contract Accounts Receivable and Payable, check numbers can be assigned during the mass creation of checks by the payment program, as well as in Online Check Printing in dialog processing.

Features

In FI-CA, you can assign check numbers using the following procedures:

1. Automatic assignment (check number = payment document number)
2. Internal assignment with sequential number
3. External assignment (preprinted check numbers on the check form)

Internal check number assignment guarantees that the check numbers are issued internally and assigned sequentially. The numbers are assigned via the check number lots. You can maintain number ranges for check number lots in the SAP menu under Settings > Current Settings > Assign Internal Check Numbers.

You can issue externally numbered checks manually or have the payment program issue them automatically.

In the Implementation Guide for Contract Accounts Receivable and Payable under Basic Functions > Check Management > Settings for Check Creation, for each combination of company code, house bank, and account, you can define which number assignment is to be used for check creation.

Number assignment for replacement checks

With automatic number assignment, the check number is the same as the payment document number. For example, if the document number is 120000004711, the check number is 120000004711. This also applies for the numbering of replacement checks. However, the first character of the document number corresponds to the number of the replacement check. For the example above, a replacement check number of **1** 120000004711 is the first replacement check, and the number **2** 120000004711 denotes the second replacement check.

Entering Issue Data

Use

Recording the data of issued checks in Check Management.

Features

Regardless of whether you create a check individually using **Online Check Printing** (SAP menu: **Payments** > **Online Check Printing**) or using the payment media run, the system automatically makes an entry in Check Management. The system makes this entry immediately after printing the check.

For checks that are numbered externally, a further activity is necessary before you can include the check information in Check Management. To transfer prenumbered checks from a payment run into Check Management, use the transaction **Transfer Prenumbered Checks from Payment Run** in the Check Management menu (**Goto** > **Transfer Payment Run**). You can thereby assign the corresponding check numbers to the payment document numbers. (See also Assigning Prenumbered Checks to Payment Data)

You enter manually issued checks in the system in check lots for manual outgoing checks (SAP menu: **Payments** > **Lots for Manual Outgoing Checks**). The check details reported by the issuer are updated in Check Management when you post the lot.

In transaction FPCHO, you can also specify which prenumbered check forms were issued to which employees. In this way, you can support clarification work that may arise from the encashment.

Assigning Prenumbered Checks to Payment Data

Use

You can use the function **Transfer Checks from Payment Run** to assign the numbers of prenumbered check forms to the corresponding payment data in a payment run. The check data is transferred to Check Management. You can also display and check previously assigned payment runs here.

Prerequisites

To be able to reset the assignment of pre-numbered checks to payment data, you must have authorization for editing function 18 of authorization object F_KK_SOND. You must also have authorization to reverse checks for the affected company codes (authorization object F_KKCR_BUK, activity 85).

Procedure

1. Choose one of the following paths:

- **Role**

  Debit Memos and Payment Run (SAP_FI_CA_DEBMEMOS_PAYMENTRUN) > Check Assignment for Payment Run

- **SAP Easy Access screen**

  Payments > Payment Run > Check Assignment to Payment Run

2. Select the Payment Run radio button to assign check numbers to payment data for a specific payment run.

   If you select All Non-Assigned Payment Runs, you can assign check numbers to payment data in all payment runs that have not yet been processed.

3. Choose Continue.

4. In the list, the payment run for which you want to include the check data in Check Management appears. If check numbers have already been assigned, the checks for each paying financial institution are displayed in a separate line.

5. Specify the interval for the check numbers assigned in this payment run in the Number From and Number To columns. If check numbers were assigned from multiple intervals (1-10 and 250-270, for example) in a check lot, proceed as follows:

   a. Specify the first check number interval in the appropriate line.

   b. Select the line and choose Edit > Insert Line in the menu.

   c. You can now specify an additional check number interval in the added line. You can repeat the insertion of lines as often as you like. Ensure that the original line is selected first. You can also add lines by clicking on the Number column in the original line.

Provided all the checks in a payment run have the status Open, you can also reset any incorrectly made assignments for the **entire** payment run. To do this, choose Assignment > Reset in the menu and enter the payment run.

Example

Due to a typing error, the system has created incorrectly numbered checks. You cannot cash the checks because the system does not recognize the check numbers.

Result

The check data for the outgoing payments contained in the payment run has been entered in Check Management.

When you reset the assignment, the system deletes the checks from the check register. You can then re-assign the numbers. If clarification cases have already been created during check encashment, you can perform encashment when you process these clarification cases.

Entering Manually Issued Checks

Use

To make manually issued checks - for example, issued by insurance agents for on-site payment - available for further processing in the system, you have to enter and post these checks in check lots for manual outgoing checks.

Prerequisites

To use lots for manual outgoing checks, make the following settings in Customizing for Contract Accounts Receivable and Payable under Basic Functions > Check Management:

- Check Clearing Account for Outgoing Checks

  The system determines the check clearing account using posting area 1061. The field Check Clearing Account for Manual Checks field has priority. If you do not enter a value in this field, the account entered in the Bank Subaccount field is used.

- Specifications for Lots for Manual Outgoing Checks

  In addition to default values for the document type and payment method to be used, you also have to define the main and subtransactions to be used for the business partner items. If necessary, you can also enter the payment lock to be used to prevent the payment run from paying the documents.

- Line Layout Variants for Lots for Manual Outgoing Checks

  Here you can define line layout variants for the item list.

  Note

  On the list screen for entering outgoing checks, you can use the pushbutton to switch between the line layout variants defined in Customizing.

Features

The check details reported by the issuer (for example, insurance agent) are updated in check management once you have entered them in a check lot and posted them. If the bank reports that a check has already been cashed before you post the lot, the system checks the encashment data against the details provided by the issuer. If there are discrepancies (for example, different amount), the system posts the issue data of this check, but adds the check to a clarification list (see Reconciling and Clarifying Outgoing Checks). When you post an item from the lot, the system posts a receivable to the contract partner specified in the item and a G/L item to a check clearing account. The receivable is locked for payment so that it cannot be paid by a payment run.

You can also enter items for documents that have already been posted in lots for manual outgoing checks. When you post the lot, the system creates only one entry in check management for each item.

You can also post individual items when you enter them in the lot. You can reverse items that have already been posted, for example, to correct input errors from manual entry.

If individual items cannot be posted, for example, because an identical entry exists in check management, you can postprocess the items in the lot. You can change all of the data entered, such as the check number, at item level. Or you can mark the item as “Deleted”, and thereby prevent a posting.

You can use an upload program to import manual outgoing check lots from external systems. You can close or post the lots, or leave them open for subsequent files. You can also postprocess incorrect items. On the SAP Easy Access screen, choose Periodic Processing > Transfer Data > Lot for Manual Outgoing Checks > Transfer/Process Errors.

You can use authorization object F_KKCMK to protect the activities for lots for manual outgoing checks.

Entering Outgoing Checks in Lots

Procedure

1. From the SAP menu, choose Payments > Lot for Manual Outgoing Checks.
2. Specify a key in the field Lot , and then choose with the quick info text Create Check Lot .

3. Define a search term to make any subsequent searches easier, and if required, additional information.

4. Define the data for the lot header:

   In the area **Total and Item Specifications** , enter control totals and items. State the total amount and the number of checks. This step is optional and is for control purposes only. If actual values differ from the defaults however, you cannot post the lot.

5. Enter the header data. This includes the following information:

   - Details for the documents to be posted:

     Document type, posting date, currency, G/L reconciliation key

   - Details for postings to the bank clearing account:

     Company code, house bank, account ID, and payment method.

     The system uses these details to determine the check clearing account to which the items are posted. If the bank reports that a check has already been cashed, the corresponding item is always posted to the same clearing account as for encashment.

   - Specifications for the check numbers

     Interval for the check numbers to be assigned (optional).

     If you enter a check number that is not in this interval, the system issues a warning message.

6. Choose **Edit** > **New Items.** .The list screen for entering payment data appears.By double-clicking on the item, you can go to the detail display. For more information about the list and detail screen, see Creating Payment Lots Manually .

7. For each check, enter one item in the check lot. You can specify all data relevant for check management, such as check number, check recipient (business partner), contract, amount, and the issue date.

   In addition, you can also enter a check voiding reason. This has the effect that the entry to be created receives the status **Invalid** in Check Management, and no document is posted.

8. Save your entries .

If you have entered all the items for a lot, close and post the lot on the initial screen of the transaction **Lot for Manual Outgoing Checks** . If you display the detail view of the items once you have successfully posted the lot, from there, you can display the check management and the document created. To do this, choose the pushbutton with the quick info text **Display Check** or **Display Document** next to the fields **Document Number** or **Check Number** .

Process Checks

Use

You want to enter, edit, and manage outgoing checks manually.

Prerequisites

You have defined the specifications for check number lots, the reporting status, void reasons, and the numbering types for checks in the Implementation Guide for Contract Accounts Receivable and Payable (see **Basic Functions** → **Check Management**).

Procedure

Choose one of the following paths:

- Role **Check Management** (SAP_FI_CA_CHECK_MANAGEMENT) → **Check Management**
- SAP Easy Access screen: **Payments** → **Check Management**

There, the following functions are available:

- Entering a Check

  To enter the data of individual outgoing checks in check management, choose **Check** → **Create** → **New**. This takes you to the transaction for entering check lots for outgoing checks. For information about how to proceed, see Entering Outgoing Checks in Lots.

- Processing Checks

  Select the checks to be processed. To do this, select one of the following radio buttons on the **Check Selection** tab page on the initial screen of Check Management:

  - Specific Check
  - Checks from Payment Run
  - Checks for Customer
  - Checks for Document
  - Checks with Status
  - Checks According to Selection Parameters

    You determine the parameters by using the **Free Selections** pushbutton.

    Choose **Continue**.

    The selected checks appear in the lower part of the processing screen. To process individual checks, select them in the overview. Then proceed as described below: If you also require the data outside the SAP system, you can save the overview.

What You Want to Do with Checks:	Procedure
Display them	To display the check data of one or more checks, select them in the overview and choose **Check** > **Display**. To display the check data of the next check, choose **Continue**.
Void	To void a check, select it in the overview and choose **Check** > **Change** > **Void**. A dialog box appears in which you can choose between the following procedures: • **Reverse Payment** The transaction for reversing the payment document appears. The check is voided in the background. • **Enter Manual Replacement Check** You can enter the replacement check manually. • **Issue/Print Replacement Check**

What You Want to Do with Checks:	Procedure
	The Void processing screen appears. After you have voided the check, select function Issue Replacement Check in the toolbar. The data of the original check is specified on the next screen. If necessary, enter a period for the validity of the replacement check and save your entry. A spool request for the replacement check is created automatically in the background. • Void/Print via Payment Run You use this function if the payment was processed by a payment run and the associated payment data has not yet been reorganized. The check is flagged as voided in check management. To issue a replacement check for the voided check, you must restart the payment media run. The time of printing results from the user settings on the Program Control tab page in the Print Mode Replacement Checks field. You can make settings for the following: ◦ Whether the replacement check is to be printed immediately and whether the print parameters can still be changed ◦ Whether printing is to take place immediately in the background. In this case, the print parameters of the variant of the payment medium run with which the original check was issued are used. ◦ Whether the replacement check is to be printed at a later time by rescheduling the payment media run in the payment run (Environment > Payment Medium). This option is useful if you want to void several checks and then print the replacement checks together. On the next screen, enter a void reason and notification status and save your entry. As a result, the check is voided. You can use the reporting status to control whether the voiding of the check is reported to the bank. If the voiding has already been reported, you can enter the reporting date and set the status to Already Reported. In Customizing, you can freely define reasons for the check voiding and define for each voiding reason whether a replacement check can be issued.
Void an entire payment run	If you have several or all checks in a payment run due to a common voiding reason (for example, Incorrect Printout), you can use the Void Payment Run function in the Check Management menu under Goto. Select the checks to be voided according to the following criteria: • Run date and payment run identification: • Check number interval, company code, house bank, or account ID Enter a void reason and, if you want to report the checks to the house bank, the reporting date, -time, and -key. Choose .

What You Want to Do with Checks:	Procedure
	The checks are voided. The system displays a list showing the number of checks according to the following categories: • Checks that can be voided • Checks already paid • Checks that have already been voided • Blocked checks If you select one of the above categories in the **Output** control list before you run the program, the list then displays not only the number of checks per category, but also each individual check with details.
Delete	To delete a check, select it in the overview, choose **Check** > **Change** > **Delete** and confirm the confirmation prompt. As a result, the check was deleted from check management. You can only delete checks with voided or open status. There must also be no replacement check for the check to be deleted.
Correct	To correct a check, select it in the overview, choose **Check** > **Change** > **Correct** and change the required data on the next screen (non-payment-dependent data). The corresponding fields are ready for input. Save the changes. You can change fields of a check created by a payment run and that by default are not ready for input by using the **Administrator** pushbutton. For this function, you need authorization 018 for authorization object F_KK_SOND.
Replace (for example, if lost)	To issue a replacement check, you have the following three options: To replace a check that was created and printed by the payment run, choose **Check** > **Change** > **Void** and select **Void/Print via Payment Run** in the dialog box that appears. Then proceed as described under “Voiding Checks”. To enter a replacement check for a check that you had issued manually: Select the relevant original check in the overview and choose **Check** > **Create** > **Replacement Check**. On the next screen, enter a void reason and a notification status and choose **Edit** → **Replacement Check**. For example, if you have already reported the loss of the check to your bank, enter **Reported** as the reporting status and add the reporting date and -key. The data of the original check is transferred for the registration of the replacement check in check management and can be enhanced. Save the data. You have voided the original check in check management and entered the replacement check data. To enter and print a replacement check at the same time, choose **Check** > **Change** > **Void** and select **Issue/Print Replacement Check** in the following dialog box. Then proceed as described under “Voiding Checks”. Alternatively, you can also use online check

What You Want to Do with Checks:	Procedure
	printing . In the transaction **Online Check Printing**, you have direct access to check management and can also void the original check in this way.
Cash	To record the cashing of a check: Select this in the overview and choose **Check** > **Change** > **Cash**. On the next screen, the check automatically receives the status **Cashed.** Define the cashing date. If there is only one cashing document for the cashed check, also specify the cashing document and its document category. If multiple cashing documents exist for the check in question, in the **Cashing Document** field, enter *, leave the field for the document category empty, and choose . A dialog box appears, in which you enter the document data for the partial encashments. Note that you can only enter data for documents from Contract Accounts Receivable and Payable here. Save your input. As a result, you have noted the cashing of the check in check management. Mass processing of cashed checks, for example, by electronic bank statement, is provided by SAP as an interface by means of a function module. (see Reconciliation and Clarification of Outgoing Checks ff.)
Assign to a payment document	From the menu, choose **Goto** > **Assign Payment**. On the following screen, specify the company code and the house bank or account ID. Choose **Execute**. The next screen displays all checks that do not have a payment document in check management. Manually assign the missing payment document number to the checks in the **Ref. to Payt Doc** field. You can use the **Free Selections** pushbutton to restrict checks by other selection criteria in addition to the company code and house bank.
Lock (**Stop Payment**)	Set the status "Locked" for the check and report the lock to the bank by using transaction FPCHX. If the period after which the bank guarantees that it will no longer cash the check (usually 24 hours), reverse the payment document automatically by regularly scheduling the transaction for reversing check payments (SAP Easy Access screen: **Periodic Processing** → **For Contract Accounts**). As a result, the cleared items are open again. If necessary, you can use a new payment run to issue a new check. Locking outgoing checks is an alternative to issuing replacement checks and is used, for example, as a stop payment in the United States. Void and reissue invalid checks that have not yet left your company. A check lock is not necessary in this case.
Maintain Owner of Check Forms	Under **Environment** > **...Check Owner**, you can augment additional information about manually-issued checks. Depending on the company code, house bank, and account ID, you can define here, for example, where a specific check number range is used.

What You Want to Do with Checks:	Procedure
	Example Checks with numbers 20000090 to 20000150 are issued at the head office. For internal purposes, you can also define an initial key here (user-defined text field). In check management, you can show the details, for example, to help you clarify fraud cases.

You can use the authorization object F_KKCR_BUK to restrict the authorization for changing data in check management to specific employees.

Check Encashment Data Transfer

Use

In order to process information about cashed checks provided by your bank, you have to copy this data into your system.

Features

The interface for the transfer of data from check encashment is either the electronic account statement or a file in a format defined by SAP. You can postprocess any errors that occur during the transfer. During the data transfer, the system makes the postings to the outgoing checks account and the bank account automatically.

Activities

To transfer the data from an electronic account statement, choose one of the following paths:

Roles

Transfer Bank Account Statements > (SAP_FI_CA_BANK_ACC_STATMENT) > Transfer from Electronic Account Statement

SAP Menu

Periodic Processing > Transfer Data > Electronic Account Statement > Transfer

For more information, see the report documentation.

To process errors that occurred during the data transfer, choose:

Roles

Transfer Bank Account Statements > (SAP_FI_CA_BANK_ACC_STATMENT) > Error Processing : Transfer from Account Statement

SAP Menu

Periodic Processing > Transfer Data > Electronic Account Statement > Process Errors

Reconciling and Clarifying Outgoing Checks

Use

As part of the processing and management of outgoing checks, in Check Management in Contract Accounts Receivable and Payable, you can also register the encashment of checks, reconcile the issue data with the encashment data reported by your bank, and clarify doubtful cases. You can use Check Management to do this for the encashment of automatic checks as well as for checks numbered externally or internally (see Check Number Assignment).

If you use **Accounts Receivable Accounting (FI-AR)** as well as **Contract Accounts Receivable and Payable (FI-CA)** , and the checks you issue are always numbered automatically (that is, the check number is the same as the payment document number), you can manage the encashment of outgoing checks in the check clearing account in the general ledger.

If you use internal or external check number assignment as well as automatic number assignment (that is, if the payment document number and the check number are different), you have to carry out the reconciliation in FI-CA.

Activities

In the Implementation Guide for **Contract Accounts Receivable and Payable** , under **Basic Functions** > **Check Management** > **Define Component for the Reconciliation of Check Encashments** , in the field **Check Reconciliation** , you can determine whether the reconciliation takes place in FI-CA or in the general ledger.

Reconciling Cashed Checks in Contract Accounts Receivable and Payable

Prerequisites

If you want to process check encashments automatically in Contract Accounts Receivable and Payable (FI-CA), make the following settings in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Basic Functions** > **Check Management.**

- Define Bank Clearing Account for the Encashment of Outgoing Checks
- Define Document Type for Check Encashment

Features

When you issue checks, one document is posted for each check. This document is reflected in the posting record **Payable** to **Issued Checks** . You define the account for issued checks in the Implementation Guide for **Contract Accounts Receivable and Payable** (Posting area 1061: **Business Transactions** > **Payments** > **Creation of Incoming/Outgoing Payments** > **Define Bank Accounts for Payment Program**). When the check is cashed, credit the account **Issued Checks** . FI-CA supports two posting scenarios:

1. One-step procedure

   For each check cashed, one posting **Issued Checks** to **Bank Account** is created.

2. Two-step procedure

   Firstly, in **General Ledger Accounting** , there is one posting for each check cashed or per total, **Cashed Checks** to **Bank Account** .

Secondly, there is one posting for each cashed check in FI-CA: **Issued Checks** to **Cashed Checks** .

The two-step procedure has the advantage that the balance of the bank account in the general ledger can be updated almost immediately. In both cases, you have to define the second account for the posting in FI-CA in Customizing. You define the **Bank Account** if you use the one-step procedure, and the **Cashed Checks Account** if you use the two-step procedure. You maintain the relevant entry in the Implementation Guide for **Contract Accounts Receivable and Payable** under **Basic Functions** > **Check Management** > **Define Bank Clearing Account for the Encashment of Outgoing Checks** .

The clearing account for **issued checks** is determined as follows:

If there is no payment document for the transfer of the encashment data because the check was issued manually, then the posting is made to the check clearing account defined in Customizing for the payment program. If the check already exists in check management, the posting is made to the check clearing account to which the payment was posted. The status of the check is then updated in check management.

If the data for a cashed check does not exist in check management yet, the system temporarily saves the encashment data separately after the posting, instead of transferring it to check management. However, the encashment is posted to the relevant bank or bank clearing account. If the issue data of the check is transferred to the system later, check management is also updated.

If you have selected **Contract Accounts Receivable and Payable** as the component for the reconciliation of check encashments in Customizing, the system does not post a document in the general ledger for each check issued; instead, it creates totals postings.

If the check encashment was posted another way (for example, manually), you can enter the encashment manually in Check Management. To do this, choose **Check** > **Change** > **Redeem** in the **Cash Management** menu.

Clarification in Contract Accounts Receivable and Payable

Use

If you cannot assign encashment data reported by your house bank to issue data, you can process these cases further in clarification processing for checks in Contract Accounts Receivable and Payable.

Features

Once you have transferred the data to the system, the system automatically compares the data reported by the bank with the issue data in Check Management. If there are discrepancies between the issue data and the encashment data, the system makes an entry in the clarification list. The system makes this entry even if the check has the status 'cashed' or 'voided'. You can clarify these cases in the transaction **Clarification Processing of Cashed Checks** (SAP menu: **Payments** > **Clarification Processing** > **Cashed Checks**) .

Discrepancies can arise as follows:

- The bank has already reported the check as cashed. The check has been cashed twice.
- The check has become invalid due to loss, and therefore has the status 'voided' in Check Management, but has still been cashed.
- The currency in which the check was issued is different to the currency in which the check was cashed, and the cashed amount is different to the translated issue amount by an amount that exceeds the tolerance limits.
- The amount for which the check was issued does not agree with the amount of the encashment.

Under certain circumstances, your bank might report encashment data that you cannot assign to any issue data. The reasons for this could be as follows:

- The data of a manually issued check was not entered in the system.
- The data of a manually issued check was entered incorrectly in the system.
- Check fraud (counterfeit checks)

You can transfer these cases to clarification processing using the function **Create Clarification Case** in the **Check Management** menu. (See Transferring Data of Cashed Checks to Clarification). The clarification cases created in this way receive the exception reason **Time Limit Exceeded** .

Transferring the Data of Cashed Checks to Clarification

Use

To transfer check encashments for which no issue data exists in check management to clarification processing, proceed as follows:

Procedure

1. From the SAP menu, choose **Payments** > **Check Management** > **Goto** > **Create Clarification Case.**
2. If necessary, restrict the encashment data to be transferred to clarification processing and select **Direct Transfer** or **Transfer Online** .
3. Choose  with the quick info text **Execute** in the application toolbar.

   Depending on the setting that you chose, the data is either transferred directly to clarification, or you can select individual entries to be transferred. To transfer individual entries, select them and then choose **Transfer to Clarification** .

Result

You can use the check and bank data for further processing in clarification processing.

Clarifying Cashed Checks

Use

An outgoing check has been reported as cashed by your house bank. However, you cannot assign transferred check data to any of the checks registered in check management, or the cashing data is different from the issue data.

Prerequisites

The check to be clarified was placed in clarification processing, either automatically or manually.

Activities

If an entry was created in the clarification list automatically for a check, proceed as follows for clarification:

From the SAP Easy Access screen, choose **Payments** > **Clarification Processing** > **Cashed Checks** . The initial screen for clarification processing appears. You can display the list of checks to be clarified as follows:

Administrator Mode

If you choose and you have the required authorization, you can display all checks that are still to be clarified or that have been clarified in the system.

Resubmission Cases

If you choose pushbutton, the list contains all clarification cases that you have set for resubmission in clarification processing (on the Resubmission tab).

Clarification list according to selection

If you do not enter any restrictions, and then choose , the list contains all clarification cases that have been assigned to you for processing.

If you make entries in the fields under Selection Screen: Clarification of Cashed Checks on the initial screen for clarification processing and choose , the clarification list contains only those cases that fulfill the selection criteria.

If you select field names in the tree structure, and then choose , you can add fields to the selection screen. If you choose , you can remove fields from the selection screen.

A list of the checks to be clarified appears.

Select an item and choose Edit Clarify. You can then use the following processing functions:

Tab	Activity
Cash	You can indicate checks as cashed in clarification processing, whereby amount differences are written off automatically. If there are amount differences, the system displays them. The expense or revenue account to be posted to is determined using posting area 1039 (see Customizing for Contract Accounts Receivable and Payable under Basic Functions Check Management Expense and Revenue Accounts for Posting Cashed Outgoing Checks).
Write-Off	You can write-off a check encashment completely. The system defaults the amount to be written off. The expense account to be posted to is determined using posting area 1039 (see Customizing for Contract Accounts Receivable and Payable under Basic Functions Check Management Expense and Revenue Accounts for Posting Cashed Outgoing Checks).
Resubmission	You can set a clarification case for resubmission.
Complete	You can set a clarification case without any further activities to Completed.

The header of the clarification processing contains the following information:

- Check data, provided it already exists in Check Management

  Choose the pushbutton to navigate directly to Check Management.

- All encashments for a check

  Double click on an item to display the encashment document.

- Overview of the clarification postings executed for a check (Clarification Postings tab)

You can also enter notes for a clarification case.

Reconciliation of Cashed Checks in the General Ledger

Use

If you do not want to reconcile cashed checks in Contract Accounts Receivable and Payable, you can also perform the reconciliation on the corresponding G/L account.

Prerequisites

In the Implementation Guide for Contract Accounts Receivable and Payable, you have specified that you want to manage encashment of outgoing checks in the general ledger. (see **Basic Functions** > **Check Management** > **Specify Component for Reconciling Check Deposits**)

You use the automatic check number assignment, in which the check number matches the number of the payment document (see Check number assignment).

Key Features

If you have selected **General Ledger Accounting** in Customizing as the component for reconciling check encashment, the system posts a single document in the general ledger for each check issued. During the transfer of totals records to the general ledger (SAP Easy Access screen **Periodic Processing** > **Forward Processing** > **Execution** > **Transfer to General Ledger)**, an individual item is created for each check payment on the **Issued Checks** G/L account. This account uses open item management.

Activities

Since, unlike in Contract Accounts Receivable and Payable, the system does not automatically compare the cashing data with the issue data when a check is cashed in General Ledger Accounting, you must use program SAPF124 after your house bank has confirmed the cashing to assign issued and cashed checks to each other. To do this, you must start the program at periodic intervals. Program SAPF124 groups together all items with the same assignment number (ZUONR). The assignment number is additional information in the line item according to which line items can be sorted. If the balance of the group is 0, the program automatically clears the items against each other. For more detailed information, see the program documentation.

When issuing the checks, you must ensure that the Assignment field is filled with the check number (= document number of the document in Contract Accounts Receivable and Payable). This is done by using a function module that is processed at event 0940. For more information, see the documentation for the sample function module FKK_SAMPLE_0940.

Clarification in the General Ledger

Features

Contract Accounts Receivable and Payable does not provide clarification processing for the reconciliation of cashed checks in the check clearing account in the general ledger. Therefore, only the age of the open item can provide indication of a possible need for clarification. However, you can carry out manual clearing at any time.

If a replacement check was issued for an automatically numbered check, this no longer has the same assignment number as the payment document. The items cannot therefore be cleared automatically in the check clearing account with program SAPF124. Instead, you have to carry out clearing manually. To determine which number was assigned for a replacement check, select the

checks issued for the payment document in Check Management for Contract Accounts Receivable and Payable. You can then carry out the clearing manually in the general ledger.

The first character of the check number of the replacement check can also provide information about the number of the original check (see Check Number Assignment).

Creating Report Files for Outgoing Checks

Use

Report RFKKCHK01 creates a sequential file that you can use for reporting all issued and voided checks to your house bank. In the USA, this is usually done in the form of a positive payment file . You can also use the report to output checks that fulfill common criteria in a list, for example, for internal purposes.

Features

In Check Management, you can create a sequential file or list by choosing **Goto** > **Create Report File** from the menu. You can thereby extract all checks that exist in the system or extract only checks that have been created or changed since the last report file was created.

To do this, you have to select the restriction by company code, house bank, and currency. In the area **General Selections** , you can refine your selection, for example, to issue only checks for a specific business partner or with a specific voiding reason or checks that were created by a specific payment media run (**Date of Execution, Execution ID**).

In the area **Specifications for Processing/Output** , you can specify whether you want to output the selected data as a file or in the form of a list. You can also decide whether the report updates Check Management, that is, whether it updates the reporting time for the individual checks and whether the entries to be updated are locked for changes while the report is being run.

Check Escheatment

Use

Contract Accounts Receivable and Payable supports the check escheatment process for checks that were not cashed by the recipient within a certain time period.

Example

In the United States, uncashed checks and money orders must be escheated to the state government after a specified amount of time has expired, when, according to federal law, they then become property of the given state. Insurance companies are required to undertake reasonable measures to find the check recipient and to determine if a check has been lost or needs to be re-issued. The last known address of the lawful check recipient determines which U.S. state laws are applicable.

Prerequisites

Activate check escheatment per company code in Customizing under **Contract Accounts Receivable and PayableOrganizational Units** > **Set Up Company Codes for Contract Accounts Receivable and Payable** .

Make additional system settings for check escheatment in Customizing under **Contract Accounts Receivable and Payable** > **Basic Functions** > **Check Management** in the activities **Enter Receiver Codes for Check Escheatment** and **Enter Specifications for Check Escheatment**.

Process

In the standard system, escheatment is handled automatically. However, at event 0431, you can intervene in the process flow and identify checks that you want to process manually in Clarification Processing. You can, for example, define event 0431 so that the system transfers checks to manual processing based on their amount and/or the address of the check recipient.

Automatic check escheatment has the following steps:

- Check creation

  At the time the check is created, the system determines the receiver code and the earliest possible start date for the escheatment process, based on the current standard address (region) of the recipient. The system stores this date in the check.

  At event 0430, you can change the receiver code and specify one of the following for the check:

  - No escheatment should take place.
  - No escheatment should take place if the check recipient's place of residence is outside of the country.

- Selection of Checks for Escheatment
- Creating Notification Letters
- Escheatment
- Payment

  The payment program automatically creates a payment advice for the recipient (the U.S. state).

- Clarification and Manual Check Processing

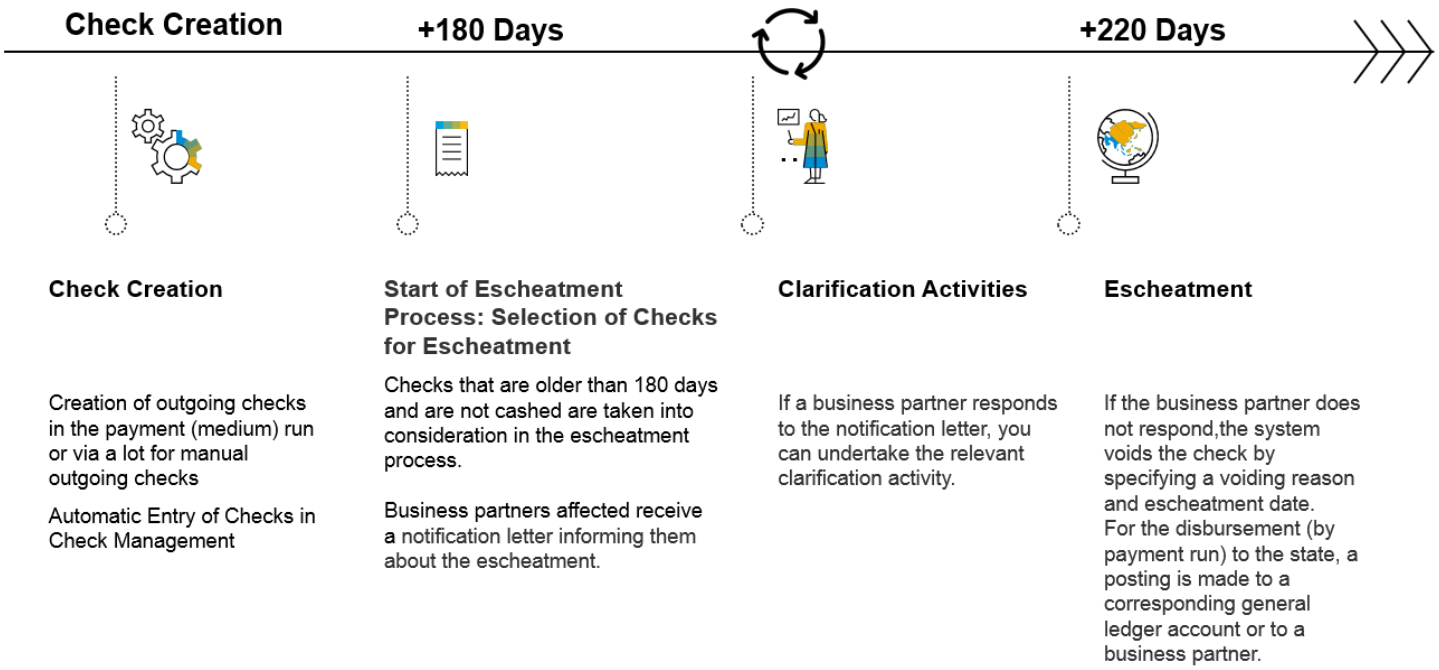

Perform the individual steps in the escheatment process at regular intervals as needed in relation to one another.

In the SAP Easy Access screen, under **Periodic Processing** > **Data for Externals** > **Tax Authorities** > **Check Escheatment** > **Display Escheatment Data**, you can display checks that are in the escheatment process or that were already escheated.

Example of an Escheatment Process

The following example shows an escheatment process that starts 180 days after the check is issued and is completed 220 days after the check is issued.

To do this, in Customizing activity **Enter Receiver Codes for Check Escheatment**, `220` is defined in field **Days to Escheatment** and `180` in field **Days Escheatment Process**.

Lifecycle of a Check with Escheatment

Selection of Checks for Escheatment

Use

To start the escheatment process, you have to select the checks that are to be escheated.

Features

You start the escheatment process by selecting all escheatable checks. Escheatable checks are those that meet the following criteria:

- Their status is open and they were not yet cashed.
- The escheatment process was not yet started for them. (The check does not contain an escheatment date.)
- They are older than the number of days specified in Customizing.
- Their amount is greater than the amount specified in Customizing.

The program generates a persistent worklist containing the checks that can be escheated and sets the escheatment date and receiver code for these checks based on the last known address of the payee.

You can also change the receiver code in event 0431.

Activities

1. On the SAP Easy Access screen, choose Periodic Processing > Data for Externals > Tax Authorities > Escheatment > Start Escheatment Process.
2. Limit the selection of checks to be escheated by making entries in the Selection Criteria group box.

3. If you have not made any specifications for the number of days until escheatment in Customizing, make an entry in the **No. of Days Until Esch. Proc.** (number of days until escheatment process) field.

4. In the **Options** group box, specify if you want to simulate the escheatment and if you want to create correspondence.

5. Run the program.

Creating Notification Letters

Use

After you have started the escheatment process, you have to create notification letters for the business partners affected.

Key Features

The system prints the notification letters using correspondence type `0046` (**Check Escheatment Letter**).

The notification letters inform payees that they are in possession of an uncashed check, which will be automatically escheated after a certain time period expires.

The system addresses the letter to the last known address of the business partner. If the check is included in automatic processing, then the system sends the letter automatically. If you are using manual processing, you can decide if you want to send correspondence or not.

In event 0431, you can prevent correspondence from being created.

SAP provides the PDF form Check Escheatment Letter (`FI_CA_CHECK_ESCHEATMENT_PDF`).

If the recipient does not respond to the notification letter, then the check is escheated automatically on the escheatment date as part of the further process flow.

If the recipient does respond, then you can remove the check from the automatic process flow and transfer it to manual processing.

Activities

To create notification letters, on the SAP Easy Access screen, choose **Periodic Processing** > **For Contract Accounts** > **Correspondence** > **Print**. The program creates notification letters. For more information, see Printing Correspondence.

Escheating Checks

Use

During check escheatment, the system voids the checks and sets the voiding reason and the escheatment date.

Features

Escheatment is controlled by the Customizing settings made for the receiver code.

During escheatment, you select all checks from automatic processing that the business partner has not cashed and for which the escheatment date for a receiver code has been reached. The system calculates the escheatment date based on the date the check was issued.

The system derives the specifications for document creation from the Customizing activity **Enter Specifications for Check Escheatment**. You can create postings for the voided checks either as individual or collective documents.

Using the settings in the Customizing activity **Enter Receiver Codes for Check Escheatment**, the system creates either G/L transfer postings or business partner postings, depending on how you manage the recipients of escheated checks in your system.

Activities

1. On the SAP Easy Access screen, choose **Periodic Processing** > **Data for Externals** > **Tax Authorities** > **Escheatment** > **Execute Escheatment**.
2. Enter the selection criteria that you want to use to select the checks.

   Also enter a reconciliation key, a posting date, and a document date for the posting.

   By setting the appropriate indicator, you can simulate the escheatment before you execute an update run.
3. Run the program.

Clarification: Manual Check Processing

Use

If a business partner responds to the notification letter, then you can react accordingly during clarification processing.

Prerequisites

Escheatable checks are included in clarification processing in these cases:

- You defined event 0431 so that certain checks are selected for manual processing.
- You set process category **2** (**Manual**) for checks already in the escheatment process. On the SAP Easy Access screen, choose **Periodic Processing** > **Data for Externals** > **Tax Authorities** > **Escheatment** > **Change Escheatment Data**.
- In check management (on the SAP Easy Access screen under **Payments**) you set process category **2** (**Manual**) for the display of the check and its escheatment data.

  In this case, the check must also already be in the check escheatment process.
- The system cannot determine a receiver code.
- Customizing is not set up or is set up incorrectly.
- You are in the check clarification process (on the SAP Easy Access screen, under **Payments** > **Clarification Activities** > **Cashed Checks**).

Features

In clarification processing, you can respond to the following reactions of the recipient:

- Cashing the check in n days

- Postponement of the escheatment date, for example, because the check needs further clarification
- Notification that the check was lost

You can:

- Issue a replacement check
- Search for the current address of the payee in the business partner data
- Create a notification letter
- Set the check for resubmission
- Specify an escheatment date that overwrites the escheatment date set by the program
- Change the receiver code in accordance with the last known address of the payee
- Specify the address to which the notification letter is sent
- Transfer a check to automatic processing

The check is escheated when the escheatment date is reached only when automatic processing is used. If you close manual processing (for instance, by entering a new address), then you must then transfer the check for automatic processing. The check escheatment is then automatic when the escheatment date is reached. If you have not yet created a notification letter, the system informs you of this.

Note

If a check is specified for manual processing, then the check cannot be escheated, even if the escheatment date has been reached.

Activities

1. To manually process the clarification worklist, on the SAP Easy Access screen, choose **Periodic Processing** > **Data for Externals** > **Tax Authorities** > **Escheatment** > **Clarification** .
2. In the tree structure on the left side of the screen, choose the parameters you want to use for selecting a check. To do so, position the cursor on a field and choose . In the same way, you can remove individual selection criteria by choosing the pushbutton .
3. Enter the selection criteria and choose .

For more information about clarification processing, choose the pushbutton in the application toolbar.

Receipt Management

Use

In the transaction **Receipt Management**, you can display all receipts for a payment document that correspond to your specified selections criteria in an overview.

Prerequisites

If you wish to use the receipt management, you can configure the following settings in Customizing for Contract Accounts Receivable and Payable:

- Activate Receipt Management under Basic Functions > Posting and Documents > Basic Settings > Maintain Central Settings for Posting. Set the indicator Receipt Management Used. If the indicator is set, the necessary clearing information in the system is recorded during the posting of payments that are used in receipt management during (repeated) printing of receipts.
- You define Specifications for the Management of Receipts under Business Transactions > Payments > Processing of Incoming and Outgoing Payments > Receipt Management.
- Each printed receipt obtains its own receipt number. The distribution of these numbers is determined by its own number range. Maintain the number range 01 under Business Transactions > Payments > Processing of Incoming and Outgoing Payments > Receipt Management > Maintain Number Ranges for Receipt Printing.
- Additionally, you can define reasons for repeat print under Business Transactions > Payments > Processing of Incoming and Outgoing Payments > Receipt Management > Define Reasons for Repeat Print.

Features

The list is output using the ABAP list viewer. You can define the display variably and individually by defining the desired layouts. You can choose the layouts in the menu under Output Parameter.

Activities

1. Choose Payments > Receipt Management.
2. Enter the parameters that you want to use to select the receipt. Using Specifications for Selection, you can restrict your selection further and thus:
    - Only output receipts that are posted for stamp tax.
    - Only output payment documents for which a receipt is also printed
    - Also output reversed receipts
3. Then choose the desired display of the pushbutton with quick info Execute or Without Displaying Individual Items pushbutton in the toolbar.

If you choose the pushbutton with quick info Execute, the system displays the relevant receipts of selection criteria individually. For payment documents that do not yet have a receipt, the program simulates a line with the print information of the receipt that has not yet been printed. If you print this receipt afterwards, the program retrieves this simulated data. The receipt lines are however only simulated, if the indicator Only Display Receipts is **Not** chosen as selection criteria. You can use the following functions in the display:

- If you display individual items in a list, you can print receipts for the displayed payment documents by selecting the relevant lines and choosing the pushbutton.
- If the relevant payment has been reversed, you can reverse the printed receipts in the list by selecting the relevant lines and choosing the pushbutton.
- By double clicking on a line you can display the payment document.
- By using the pushbutton , you can navigate to the transaction for the mass printing of receipts.

If you choose the pushbutton Without Individual Item Display, the amounts, net amounts and tax stamp amounts are outputted in total using the company code, origin of the payment document, processor, bank branch and cash desk. The system displays this

information in the ABAP List Viewer. By selecting a totals line, you can branch to the display of the individual items that were considered in the relevant totals line.

Mass Run for Printing Receipts

Use

Using mass receipt printing you can place receipts for payment documents posted by the payment run or a payment order lot in a correspondence container.

Features

If Receipt Management is active, the system assigns a receipt number during clearing if a payment is posted by the payment run or a payment order lot. For items cleared by the payment run or a payment order, the system also sets a status that permits receipt printing or download to a hand held PC.

Payments from the payment run or a payment order lot that have not been printed or downloaded and that correspond to the selection criteria entered in the mass activity are placed in the correspondence container for receipt printing.

Activities

1. In the SAP menu, choose **Periodic Processing** > **For Contract Accounts** > **Receipt Printing** .
2. Enter a date and an ID that you can use to identify the run later.
3. On the tab page **General Selections** , you can restrict the payment documents to be selected by business partner, contract account, contract, company code of the payment document, and/or posting date.
4. On the tab page **Free Parameters** , you can restrict even further using all fields of the tables in which the clearing information of the payment document that is required for printing receipts is stored.
5. Schedule the program run. For test purposes, you can also start the mass receipt print in simulation mode (see also Functions for Scheduling Program Runs).

Via **Correspondence Printing** in the menu under **Periodic Processing** > **For Contract Accounts** > **Correspondence** > **Print** , you can print the receipts in the correspondence container.

Processing of Credits

Use

If you want to clarify the use of credits on the contract accounts of your business partners, you can use the following functions:

- **Clarify Credit** (transaction FPCRP0)
- **Process Credit** (transaction FPTCRP0)

You can use the **Credit Clarification** function to process credits that do the following:

- Were selected with the **Create Credit List** mass activity and placed in clarification processing
- Were set directly in the clarification list during posting owing to the settings defined in Customizing.

The Process Credit function is only recommended for the manual processing of individual credits that were not entered by the credit list.

In credit clarification as well as in credit processing, you can perform a return of payment on account to clarification for a credit.

Integration

If the credit items are not automatically included in the clarification worklist during posting due to the system settings for credit clarification, you have to execute the mass activity Create Credit List at periodic intervals. (See Create Credit List)

Prerequisites

In the Implementation Guide for Contract Accounts Receivable and Payable under Business Transactions > Credit , you have defined the document types that are to be used for posting credits. Under Business Transactions > Credits > Define Selection Criteria for Credit Clarification , you have defined the parameters according to which an item is to be placed in the clarification worklist either directly during posting or using the credit list. By setting the Immediately indicator, you determine whether or not an item reaches the clarification worklist directly during posting or through the credit list.

You have activated the reposting of payment on account for clearing in Customizing for Contract Accounts Receivable and Payable under Basic Functions > Postings and Documents > Basic Settings > Maintain Central Settings for Posting by setting the Parallel Tax Update for U.S.A. indicator.

Creating Credit Lists

Use

In order to be able to clarify existing credits systematically, you first have to place them in clarification processing using the function Create Credit List .

Prerequisites

In Customizing, you have maintained the settings that the credit list is to use to select the credits. (See Implementation Guide for Contract Accounts Receivable and Payable , Business Transactions > Credit > Define Selection Criteria for Credit Clarification).

Procedure

1. In the SAP menu, choose Periodic Processing > For Contract Accounts > Create Credit Lists .
2. Assign a date ID and run ID that you can use later to identify the program run.
3. On the General Selections tab, restrict the selection of credits using the following parameters:
    a. Business partners
    b. Contract account
    c. Contract
    d. Company code
    e. Due date
    f. Posting date

4. If you set the indicator **Relevant Credit** on the **Options** tab, the system checks whether the items in the credit list are still open. Items that have been clarified in the meantime are marked as **Completed** in the list.

5. For more information about scheduling and executing mass activities, see Functions for Scheduling Program Runs .

Result

The existing credits in the system were selected according to your selection criteria and placed in clarification processing.

Clarify Credits

Use

You can use credit clarification if you want to process existing credits systematically on the accounts of your business partners.

Prerequisites

The relevant credit items must use the mass activity Create Credit List or are to be placed directly in clarification processing during posting.

To clarify multiple credits simultaneously, you set the **Enhanced Credit Processing** indicator in Customizing for Contract Accounts Receivable and Payable under **Basic Functions** > **Postings and Documents** > **Basic Settings** > **Maintain Central Settings for Posting**.

Procedure

1. Choose **Payments** > **Credits** > **Clarification** from the SAP Easy Access screen. The initial screen for clarification processing appears. You can display the list of checks to be clarified as follows:

    - Administrator Mode

      If you choose **Administrator Mode** pushbutton and have the required authorization, you can display all credits that are still to be clarified or that have been clarified in the system.

    - Resubmission Cases

      If you choose the **Resubmission Cases** pushbutton, all credits are displayed in the list for which you previously selected **Credit Remains in Account Until** on the tab **Retain** in clarification processing.

    - Clarification list according to selection

      If you fill the required fields in the selection screen in the initial screen for clarification processing and choose with the quick info text **Execute**, the clarification list will only contain the credits that meet these requirements. If you do not enter any restrictions, and choose with the quick info text **Execute**, the list displays all credits that have been assigned to you for processing. If you select field names in the tree structure, and then choose the pushbutton with quick info**Apply Selected Entries**, you can add fields to the selection screen. If you choose with quick info **Delete Selected Entries**, you can remove fields from the selection screen.

      The system displays a list of credits to be clarified.

2. Select an item and choose **Edit** > **Clarify**. You can then use the following processing functions:

Tab Page	Activity
Bank transfer	You can transfer the credit in full or part of it to any bank account, even if the master data for this account does not exist in your system, that is, the owner of the bank account is not a business partner. If you repay an incoming payment to a business partner with the function ⇨Transfer return on the tab page Transfer, the clearing account is determined using posting area 0130 (see Implementation Guide for Contract Accounts Receivable and Payable ▶Business Transactions ▶ Payments ▶ Incoming / Outgoing Payment Processing ▶ Define Specifications for Repayment of Incoming Payments ▶). If you transfer a credit that does not result from an incoming payment, the account determination takes place via posting area 1321 (see Implementation Guide for Contract Accounts Receivable and Payable, ▶Business Transactions ▶ Credits ▶ Define Clearing Account for Transferring Credits ▶).
Outgoing Payment	You can the make a repayment in full or in part of the credit to the payer or another business partner.
Retain	If you select Credit Remains in Account Till and enter a date, the credit remains in the clarification list until the specified date and is displayed as a resubmission case. If you select Credit Remains in Account Permanently, the credit item does not appear in clarification processing even if you recreate the credit list.
Clearing	You can clear the credit in full or as a partial amount with another item from the same partner, account, or contract (account maintenance).
Transfer Posting	You can transfer the credit in full or in part to another partner, another account or another contract.
Write-Off	You can write off the credit in full to a G/L account. The text specified for the write-off is automatically copied into the G/L document.

Tab Page	Activity
Send Clarification Letter	If you are not able to assign a credit, you can send the business partner concerned a clarification notification and ask for clarification. a. Then choose the Clarification Letter pushbutton in the application toolbar. b. In the processing dialog that appears, you can set the application form to be used on the tab page print parameter. In the standard system, the system proposes the application form defined for the correspondence type (0032) in Customizing. c. Choose with the quick info text Print Immediately using Printer Specified for immediate printing, or with the quick info text Set in Print Dataset of Mass Printing, to set the correspondence in the dataset for the mass print settings.

Locks for the following objects are displayed in the header of clarification processing.

- Document
- Contract account
- Insurance object (industry component Insurance)
- Contract object (industry component Public Services)

  On the Disbursements tab page, you can change these locks or create new ones.

Simultaneous selection and processing of multiple credits

You can select and edit multiple credits simultaneously Several credits can now be paid out simultaneously or a common workflow can be triggered for paying them. You can also enter several partial amounts for almost all functions. The total amount to be disbursed, cleared, or transferred is a result of the total of the partial amounts entered in the list screen of selected items.

This means that a change of document is no longer executed (entry of payment method and bank details) for the function Pay. Instead, a payment specification is created for all of the selected items that, in addition to the items, also contain the payment details (such as payment method, bank details). In order for the payment specifications to then be processed in the payment run, you have to set the Payment Specifications indicator in the Selection Criteria group box when you enter the parameters for the payment run.

Processing Credits

Use

You use the function Process Credits to manually process individual credits that have not been placed in credit processing by the credit list.

Prerequisites

To use **enhanced credit processing**, you set the Enhanced Credit Processing indicator in Customizing for Contract Accounts Receivable and Payable under Basic Functions > Postings and Documents > Basic Settings > Maintain Central Settings for Posting.

Procedure

Standard Credit Processing

1. On the SAP Easy Access screen, choose Account > Process Credits.
2. Restrict your selection using one or more of the following parameters:
    - Business partner
    - Contract account
    - Contract
    - Company Code
    - Document number
3. Choose Continue.
4. On the lower part of the screen, the credit items that have been selected for processing based on your criteria appear.
5. Select a credit and choose Clarification > Execute.
6. The screen for clarification processing for credits appears. Here you can use the processing options described in Clarifying Credits. However, you cannot specify that credits are to remain in the clarification list.

Enhanced Credit Processing

Follow the procedure for standard credit processing. The following functions are also available:

- You can process multiple credits at the same time in one step (such as, payment, transfer, payment by check, and write-off).
- You can also enter partial amounts in all credit processing processes. For example, you can pay out different partial amounts of different items together in one step by creating a repayment request for them.

Enhanced credit processing offers the enhancements listed below in the individual functions:

Function	Enhancement
Transfer	The system creates a repayment request (with an outgoing payment method of the type “Transfer”) for all selected items that have the same account assignments for their segment, business area and profit center. If the mentioned account assignments are different for the different selected items, then the system creates multiple repayment requests accordingly. You can make differing specifications specifically for your installation at event 4261. To have the payment run process the repayment requests, you have to set the Repayment Requests indicator in the payment run parameters.

Payment	The system does not use document changes to put into effect changes to selected items (entries for bank details and payment method). Instead, the system creates a payment specification for all selected items and notes the entered payment data in the header. To have the payment run select and process these payment specifications later, you have to set the **Payment Specifications** indicator in the parameters for item selection in the payment run.
Check	The system creates a repayment request (with an outgoing payment method of the type “Check”) for all selected items that have the same account assignments for their segment, business area and profit center. If the mentioned account assignments are different for the different selected items, then the system creates multiple repayment requests accordingly. You can make differing specifications specifically for your installation at event 4261. To have the payment run process the repayment requests, you have to set the **Repayment Requests** indicator in the payment run parameters.
Writing Off	The system writes off the entered (partial) amounts of all selected items together.
Clearing	The system clears the entered (partial) amounts of all selected items against the open items of the business partner, the contract account, or the contract. The system displays the selected open items and activates the selected items. Then you can activate any applicable additional items in dialog mode and thereby clear the credit.
Business Partner Transfer	The system transfers the entered (partial) amounts of all selected items to the specified business partner.
General Ledger Transfer	The system transfers the entered (partial) amounts of all selected items to the general ledger account that you entered using the short account.

Down Payments

You can post and process down payment requests and down payments. If down payments are relevant for taxes, you have to enter a tax code. It is possible to post both with single and multiple taxes.

Down Payments with a Single Tax

When posting down payment requests and down payments with a tax, the system does not post the tax as a general ledger item in the FI-CA document but references these in totals records and first posts these during the transfer to the general ledger. The tax accounts and tax clearing accounts to be posted are entered during this process in the business partner item (fields `MWSKO` and `MWVKO`).

Example

You enter down payments manually in the transaction for manually posting documents (see Entering Down Payment Items).

Down Payments with Multi-Level Tax

Use

To be able to post down payment requests and down payments with multiple taxes, you have to activate the function in Customizing for each company code. To do so, set the **Down Payments with Multi-Level Tax** indicator in Customizing for Contract Accounts Receivable and Payable under **Organizational Units** > **Set Up Company Codes for Contract Accounts Receivable and Payable**.

Features

If the tax code contains multiple tax types, the system enters the tax amount, tax account, and tax clearing account in an append table for the business partner item.

Keep in mind the following when posting and processing down payments and down payment requests with multiple taxes:

Business Transaction	Note
Posting	Posting of down payment requests and down payments with multi-level tax is possible for: • Manual posting of documents in transaction FPE1 • Posting of documents with the BAPI BAPI_CTRACDOCUMENT_CREATE • Posting of documents with the BOR object CA_DOC SAP • Posting of documents by using SAP Convergent Invoicing
Clearing	When you clear a down payment request, the tax data is inherited in the resulting down payment. During a partial clearing of a down payment request or down payment, the tax data is also split in the append table for the business partner item.
Manual Item Splitting	The tax data in the new append table for the business partner item is split during an item split from a mass change (transaction FPE2M) or from account maintenance using the **Change** function (transaction FP06).
Transfer to General Ledger Accounting (FI-GL)	For down payments with multiple taxes, all tax postings are posted during the transfer to the general ledger.
Repetition Items	You can post down payment requests with multiple taxes using repetition items.
Open Item List	In the open item list (transaction FP01), the tax clearing accounts from the new append table are also displayed.

Tax Reporting	During tax reporting, the tax information for down payments is written to table DFKKREP06 by means of events 0010 (function module FKK_EVENT_0010_REPDATA_GENTX) and 0020 (function module FKK_EVENT_0020_REPDATA_GENTX). For down payments with multiple taxes, a separate entry is made in table DFKKREP06 for each tax item. The item number (OPUPK) is entered in table DFKKREP06 as a number for the tax item, and the item number of the document is stored in a separate field (DP_OPUPK).
Payment on Account as Down Payment	If the **Post Payment on Acct as Down Payment** function is active in the company code, you can also post payments on account as down payments with multiple taxes in the following processes: • Payment lot (transaction FP05), check lot (transaction FP25), credit card lot (transaction FP35), as well as their corresponding clarification functions • Cash desk (transaction FPCD) • Cash journal (transaction FPCJ) • Clearing reset (transaction FP07) • External cash desk services

ℹ Note

The append table with the tax data is archived with the document (archiving object FI_MKKDOC).
