Financial Operations

Financial Operations consists of functions in areas like Receivables Management, Invoice Management, and Settlement Management.

For more information on Financial Operations, see:

- Invoice Management
- Receivables Management
- Settlement Management
- Contract Accounting
- Flexible Real Estate Management (RE-FX)
- Travel Management (FI-TV)

Invoice Management

Invoice Management helps you to streamline accounts payables and reduce costs with better exception handling, validation, and routing of invoices using SAP Fiori apps.

If you don't want to use SAP Fiori apps and are looking for help on SAP GUI transactions, please go to Accounts Receivable (FI-AR) and Accounts Payable (FI-AP).

Document Processing

The following apps are related to document processing:

- Import Supplier Invoices
- Manage Supplier Line Items
- Manage Supplier Down Payment Requests
- Clear Outgoing Payments
- Maintain Payment Blocks
- Manage Payment Blocks
- Create Incoming Invoices

Import Supplier Invoices

With this app, you can import multiple supplier invoices into the system all at once. You download a template file, enter the invoice information, and upload the completed file back to the app. You can then post the invoices from the app.

Key Features

- Download a template file of Microsoft Excel (`.xlsx`) type or Google Workspace type to, or upload one from a local device or Google Workspace. (Prerequisites needed. See Integrating with Google Workspace.)
- Enter header data and G/L account items information for the invoices in the downloaded file.
- Upload the entered invoices to the app.

> **Note**
>
> Purchase-order-based invoices are not supported.

- Check for errors in the invoices before posting.
- Set the status of the invoices to completed.
- Post the uploaded invoices.
- View errors in the invoice upload, check, and posting processes.
- Navigate to the Create Supplier Invoice tile, which is part of the Manage Supplier Invoices app, to view invoice details, correct errors, or post the invoice.

How to Import Supplier Invoices (English Only)

Open this video in a new window

Open this video in a new window

> **Note**
>
> Captions are available for **multiple languages**. Use the **CC** (Closed Captions) button in the video player to check which languages are supported.
>
> You can also use the **Search within video** field to search for specific text in the English or German captions.

Supported Device Types

- Desktop

Navigation Targets

The app enables you to access the following tile directly:

- Create Supplier Invoice

Component for Customer Incidents

`FI-FIO-AP`

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Example

Business Process

The business process for using the **Import Supplier Invoices** app can be illustrated in the following figure:

As the figure above shows, you use the app as follows:

1. Download the template from the app.

   The downloaded file is saved in `.xlsx` format. You use a spreadsheet processing program, for example Microsoft Excel, to open and edit the file.

2. Enter supplier invoices in the downloaded file. Optionally, you can add additional information for the invoices by extending the template.

   For more information, see General Information About the Template.

3. Upload the completed file to the app. You can upload only one file at a time.

   > **Note**
   > After you upload the file, you must clear your worklist before you can upload again. To clear your worklist, post all the invoices without errors and delete all the invoices with errors.

   After you upload an invoice, the invoice status is draft. You can post, hold, or park the invoice in the **Create Supplier Invoice** app.

4. Check for errors in the uploaded invoices:

   If there are errors with an invoice, you have the following options:.

   - Delete the invoice and upload it again with the correct information.
   - Open the invoice in the **Create Supplier Invoice** app and correct the errors there.

5. Post the invoices.

   You can find the posted invoices in the **Supplier Invoices List** app.

General Information About the Template

Pre-defined Rows

The template consists of six pre-defined rows. These rows provide you with information about the template and the available fields for which you can enter data for the invoices.

ℹ Note

Instructions on how to use the template in this documentation are for Microsoft Excel only. If you use another spreadsheet processing program, how you carry out certain operations, such as unhiding columns, might be different.

The following table explains the pre-defined rows:

Row Number	Content	Explanation
1	Import Supplier Invoices Unhide the columns at the end of each section to view additional fields.	Indicates the name of the app that the template file is used for. The sentence in cell 1C reminds you that this template includes hidden columns. For more information about the hidden columns, see the Hidden Columns subsection below.
2	Last Updated	Specifies the time when the file was last updated.
3	Empty	This row is intentionally left blank.
4	Section titles	Indicates the titles of the two sections: Header Data and G/L Account Items. Do not change the section titles.
5	Technical names of fields	Indicates the technical names of the fields for the invoices. This row is by default hidden. To make it visible, proceed as follows: 1. Click, hold, and drag row 4 until row 6 is also selected. 2. Release your mouse. 3. Right-click the selected area and choose Unhide from the context menu. Do not change the technical names.
6	Field names	Indicates the field names for the invoices. A field name that is preceded by an asterisk (*) is a required field. The number in the brackets behind each field name indicates the maximum number of characters you can enter for the field.

When you import the file to the Import Supplier Invoices app, the app uses the technical names of fields in row 5 to determine what data is entered for each column. It ignores the field names in row 6. This means that if somehow a field name in row 6 doesn't

match the technical name in row 5, for example you switched two field names but left the technical names intact, the data you entered will be interpreted incorrectly by the app.

Hidden Columns

The template includes columns that are hidden by default in both the **Header Data** section and the **G/L Account Items** section. Hidden columns are for fields that are comparatively less frequently used. Once made visible, these columns can be used in the same way as those that are visible by default.

To make the hidden columns visible, proceed as follows:

1. Click, hold, and drag the last column of a section until the next column is also selected.
2. Release your mouse.
3. Right-click the selected area and choose **Unhide** from the context menu.

> **Note**
> Hidden columns are invisible to you, but not to the **Import Supplier Invoices** app. If you hide a column that contains data, the data will be imported when you upload the completed file back to the app.

More Information

For information about the fields that are by default visible in the downloaded template, see Default Fields in the Template.

For information about all the fields in the **Header Data** section, see All the Fields in Header Data.

For information about all the fields in the **G/L Account Items** section, see All the Fields in G/L Account Items.

Your Entries

You enter invoices starting with the seventh row. You can enter a maximum of 2,000 entries in the file. If you have more than 2,000 entries, split them up and upload them separately.

> **Note**
> As the maximum number of entries in an invoice during posting is limited to 999, avoid entering entries more than that number in a single invoice.

To avoid entering incorrect data, adopt the following rules:

- If you copy data from an old template that contains no hidden columns, make sure that you paste the data into the correct columns in the new template.
- If you want to change the order of two fields, change the order of the two corresponding columns.
- If you don't want to enter information in an optional field, leave the field empty or delete the entire column. Hiding the column will not help.
- If you want to add a field that you have previously deleted, insert a new column and add the corresponding technical name in row 5 and the corresponding field name in row 6.

More Information

For example entries, see Example.

Default Fields in the Template

The following table explains how to fill out the fields that are by default visible in the downloaded template:

Section	Field Name	Explanation
	*Invoice ID	Enter a positive integer. Invoice IDs follow an incremental sequence, such as 1,2,5,6...The ID of the first invoice does not have to be 1. It can be any positive integer. If you want to post an invoice to multiple G/L accounts, create multiple entries for the invoice. Enter identical information for the entries in the Header Data section and the respective information in the G/L Account Items section. Use the same invoice ID for these entries. This field does not belong to any section. An entry in this field is required.
Header Data	*Company Code (4)	Enter the company code for posting the invoice. Enter a maximum of four characters. If you want to carry out cross-company-code posting, enter the second company code in the Company Code (4) field in the G/L Account Item section. An entry in this field is required.
	*Transaction (1) 1=Invoice; 2=Credit Memo	Enter 1 or 2 to specify the business transaction to be posted. 1 stands for invoice. 2 stands for credit memo. An entry in this field is required.
	Invoicing Party (10)	Enter the business partner that has issued the invoice. Enter a maximum of 10 characters.
	Reference (16)	Enter the reference document number that can include the document number of the supplier or a different entry. Enter a maximum of 16 characters.
	*Document Date	Enter the date in the format that is recognized by your spreadsheet processing program. If the spreadsheet processing program automatically formats the date you entered, for example changing 08/31/2017 to 8/31/2017, leave the formatted date as it is. An entry in this field is required.
	*Posting Date	Enter the date on which the invoice is posted to the G/L accounts in the format

Section	Field Name	Explanation
		that is recognized by your spreadsheet processing program. If the spreadsheet processing program automatically formats the date you entered, for example changing 08/31/2017 to 8/31/2017, leave the formatted date as it is. An entry in this field is required.
	*Document Type (2)	Enter the invoice type. Enter a maximum of two characters. An entry in this field is required.
	Document Header Text (25)	Enter the header text for the invoice. Enter a maximum of 25 characters.
	Currency (5)	Enter the currency of the invoice. Enter a maximum of five letters.
	*Gross Invoice Amount in Document Currency	Enter the gross amount of the invoice in the invoice currency. An entry in this field is required.
	Business Place (4)	Enter the business place for the invoice. This field is relevant only for a few countries or regions.
G/L Account Items	Company Code (4)	Enter the second company code for cross-company-code posting. Enter a maximum of four characters. If you want to post the invoice to only one company code, leave this field blank and enter the company code in the *Company Code (4) field in the Header Data section.
	Account (10)	Enter the number of the G/L account. Enter a maximum of 10 digits.
	Item Text (50)	Enter the description for the G/L account item. Enter a maximum of 50 characters.
	Debit/Credit (1) S=Debit; H=Credit	Enter S or H to specify whether the item is a debit or credit. S stands for debit. H stands for credit.
	Amount in Document Currency	Enter the amount to post to the G/L account in the invoice currency.
	Tax Code (2)	Enter the code that represents the specifications used for calculating and displaying tax. Enter two characters.
	Tax Jurisdiction (15)	Enter the geographical area that has a specific tax rate legislated by the governing

Section	Field Name	Explanation
		tax authority. Enter a maximum of 15 characters.
	Assignment (18)	Enter the number that is used to sort and display line items. Enter a maximum of 18 digits.
	Cost Center (10)	Enter the cost center that is assigned to the G/L account. Enter a maximum of 10 digits.
	Profit Center (10)	Enter the profit center that is assigned to the G/L account. Enter a maximum of 10 digits.
	Order Number (12)	Enter the sales order number for the invoice. Enter a maximum of 12 digits.
	WBS Element (8)	Enter the work breakdown structure (WBS) element for the G/L account. Enter a maximum of eight characters.

Example

The following table shows a few example entries in the template:

ℹ Note

This example uses the date format MM/DD/YYYY. When you enter invoices, use the date format that is recognized by your spreadsheet processing program.

If the spreadsheet processing program automatically formats the date you entered, for example changing 08/20/2019 to 8/20/2019, leave the formatted date as it is.

Manage Supplier Line Items

Use

You can use this app for ad-hoc requests or recurring reports to easily find supplier line items using a wide range of search criteria. For example, you can see all line items of a supplier account or all open supplier invoices for a company code that are overdue at a key date.

To make your work more efficient, you can personalize the layout of the table, predefine recurring queries, and save your settings as variants.

In addition to displaying data, you can also take various actions such as setting a payment block or creating a manual payment. You can export the data to a file and send them to a colleague. The app also serves as a navigation target from other apps, allowing users to drill down into the supplier line items.

Key Features

- Find supplier line items using a wide range of search criteria
- Sort and group the selected data
- Export data to a spreadsheet, for example, to send a list of open items to a supplier

  Note that the SAPUI5 client-side export used by this app has a limitation on the data volume that can be exported. For more information, see the 2630594 .
- Set or remove payment blocks
- Change line item attributes such as payment data, assignment, or line item text
- Create a manual payment
- Create predefined queries using selection variants
- Personalize the settings of the table using layout variants
- Send emails

ℹ Note

This app contains in-app help for key fields and concepts. To display the help while working in the app, press F1 or click the question mark displayed in the app header.

Supported Device Types

Information for Key Users

The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. To see this app's Fiori content, go to the SAP Fiori apps reference library and search for the app. Then select the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

App Extensibility: Manage Supplier Line Items

You can extend the **Manage Supplier Line Items** app according to your business needs for different aspects. For this purpose, the following extensibility options are available:

Data Source Extensions

The **Manage Supplier Line Items** app is based on the **Supplier Line Items** data source. You can add SAP fields to this data source in the **Data Source Extensions** section of the **Custom Fields and Logic** app and publish your extension.

This enables you, for example, to include the following information into the selection criteria for supplier line items and to display them in the results table:

- Supplier master data details, such as the supplier fax number
- Address data and tax data of suppliers with which you do business only once
- Contact details, such as the email address, of the accounting clerk of a supplier

For more information about how to adapt an SAP Fiori UI at runtime, see Making UI Changes (Object Pages).

Further Extensibility Entities

UI Controller Hooks

To plug in and execute custom code, the following hooks are available in the controller code:

Controller	Hook	Use
`S1.controller.js`	`extHookModifyFooterOptions`	Allows you to define your own actions for the footer bar

If there are additional UI controller hooks available in the controller code, you can extend the UI controller code. For more information about UI controller hooks, see Extend SAP Fiori Apps.

More Information

For a general description of the extensibility options and procedures of SAP Fiori apps, see Extend SAP Fiori Apps.

Schedule Jobs for Supplier Line Items Mass Change

App ID:F7225

With this app, you can edit more than 50 line items at once. Note that it's not a standalone app. The mass change job can only be started from the **Manage Supplier Line Items** app.

Key Features

You can use this app to do the following:

- Edit more than 50 line items in a mass change.
- Display the application log.
- Monitor the status of change jobs.
- Cancel long-running jobs.

ⓘ Note

If you select more than 50 line items for editing in the **Manage Supplier Line Items** app, the mass change job is scheduled to perform the changes.

Supported Device Types

- Desktop
- Tablet

Related Information

Manage Supplier Line Items

Country/Region-Specific Extensions

The following country/region-specific extensions are available in the **Manage Supplier Line Items** app when using a company code that is relevant in the given country/region:

Country/Region	Description of Extension
Thailand	You can add the fields **Branch Code** and **Branch Code Description** as a filter in Adapt Filters for the app and export the corresponding columns to spreadsheets.

Manage Supplier Down Payment Requests

Use

With this app you can create down payment requests manually. In most cases, the system automatically creates down payment requests from suppliers based on the supplier's purchase order. However, if a supplier requests a down payment, that was not specified in the purchase order, for example by sending an email or a fax, you can create it manually. Once the payment run has made the down payment, the payment run also automatically clears the corresponding down payment request. In some cases you might need to clear the down payment request manually, for example if differences occur because you paid less, split the payment, or made the payment manually.

Key Features

- View existing down payment requests from suppliers
- Export the table of existing down payment requests to a spreadsheet
- Change existing down payment requests
- Create new down payment requests
- Add notes and attachments to down payment requests

Supported Device Types

- Desktop
- Tablet

Relevant Business Catalog

- Accounts Payable – Operational Processing (`SAP_SFIN_BC_AP_OPERATIONS`)
- Accounts Payable – Payments (`SAP_SFIN_BC_AP_PAY_PROC`)

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Down Payment Request
Manage Customer Down Payment Requests

Support Alternative Payee

You can now create down payment requests for an Alternative Payee of the supplier.

Purpose

Down payment requests serve as triggers for the payment program to pay supplier accounts with a down payment.

Down payment requests can be created for an Alternative Payee of the supplier. You can enter document-specific data such as **Name**, **Address**, **IBAN**, or **Bank Account** for the Alternative Payee.

Key Features

- If the supplier is allowed to use Alternative Payee, you can click the **Alternative Payee** button to maintain the data in the pop-up screen.
- **Name**, **City**, and **Country/Region** are mandatory fields that need to be entered for the Alternative Payee.
- For **Bank**, you can select two different methods to maintain the bank relevant data, **Bank Account**, or **IBAN** via the Bank Account or IBAN button. You should ensure that the bank data is consistent, and that the bank master data is well maintained in the system.
- You can also enter the **Bank Account** or **IBAN** to derive the rest of relevant bank data.
- To delete the Alternative Payee, simply click the **Delete** button.

Supported Device Types

- Desktop
- Tablet

Support QR-Bill in Manage Supplier Down Payment Requests

You can now use QR-Bill relevant data for Manage Supplier Down Payment Requests.

Purpose

Down payment requests serve as triggers for the payment program to pay supplier accounts with a down payment.

You can maintain QR-Bill relevant data in Manage Supplier Down Payment Requests.

Prerequisite

How to use QR-Bill:
https://help.sap.com/docs/SAP_ERP/e30f1412c68a45d6b6d97fc532cb37bd/a0c3d1301c8f49169d8432392df639dc.html?state=DRAFT&q=QR%20Bill

Key Features

You can maintain QR-Bill relevant data with three variants:

1. QR IBAN with QR Reference
    - For a standard supplier, you can maintain **QR Reference** in the line item of the down payment request. You can select Partner Bank Type for the QR IBAN or go to the pop-up window by clicking the **QR IBAN** button. In the pop-up window, you can select QR IBAN from the value help, and maintain the **Additional Info** field.
    - For Alternative Payee, you can maintain **QR Reference** in the line item of the down payment request. You can maintain document-specific data such as name, address, and tax in the pop-up window by clicking the **QR IBAN** button. In the pop-up window, you can enter the **QR IBAN** and **Additional Info**.
2. Standard IBAN without QR Reference
    - For a standard supplier, you can select the Partner Bank Type for a standard IBAN. If you want to enter **Additional Info**, you can enter the content in the pop-up window by clicking the **QR IBAN** button.

- For Alternative Payee, you can maintain document specific data such as name, address, and tax in the pop-up window by clicking the **QR IBAN** button. In the pop-up window, you can enter a standard IBAN and **Additional Info**.

3. Standard IBAN with ISO creditor reference

    - The ISO creditor reference type is a maximum 25-digit reference generated according to ISO 11649. The reference starts with 'RF'; is then followed by 2 check digits and then a maximum of 21 characters; for a total of 25 characters at most. You can use this reference type with a standard IBAN and not with a QR-IBAN. The ISO 11649 reference can be used internationally

ℹ Note

The QR-IBAN is the International Bank Account Number (IBAN) that identifies the supplier's international bank account number being used during a payment transaction. The QR-IBAN contains the QR-IID (bank identification) in positions 5-9, using a number range from 30000 through 31999. QR-IBAN must be used for payments with a structured reference. The formal structure of this IBAN corresponds to the rules defined in ISO 13616.

The QR reference type is a 27-digit reference. This reference type follows the same rules as the former ISR reference. Position 27 contains a check digit according to modulo 10 recursive. It can be used with a QR-IBAN (IID 30000-31999) only.

Supported Device Types

- Desktop
- Tablet

Related Information

For more information on how to use the QR-Bill please visit https://help.sap.com/docs/SAP_ERP/e30f1412c68a45d6b6d97fc532cb37bd/a0c3d1301c8f49169d8432392df639dc.html?state=DRAFT&q=QR%20Bill

Country/Region-Specific Fields

The following country/region-specific fields are available in the **Manage Supplier Down Payment Requests** app when using a company code that is relevant in the given country/region:

Country/Region	Description of Fields
Bulgaria	VAT document type
Croatia	**Invoice Number**: Specifies the invoice number in long format.
Hungary	**Invoice Date**: Specifies the invoice date. **Invoice Number**: Specifies the invoice number. **Preceding Invoice Number**: Specifies the number of the preceding invoice.
Poland	You can maintain the **Transaction Date** field with the date a business operation occurred so that this information is included in the header of the document.
Singapore	**Long Header Text**: Specifies long explanations or notes with up to 50 characters which apply to the document as a whole, that is, not only for certain line items.

Country/Region	Description of Fields
Slovakia	In **Invoice Number** and **Original Invoice**, you can enter the invoice number and the number of the original invoice.
Slovenia	**Document Reference Number**: Specifies the document number in long format. Enter the document number if it exceeds the standard length.
Switzerland	You can create, change, or display down payment requests from suppliers using this app. You can enter the QR-bill data in the app during the creation of a new supplier down payment request.
Thailand	You can add the fields **Branch Code** and **Branch Code Description** as a filter in Adapt Filters for the app and export the corresponding columns to spreadsheets.

Clear Outgoing Payments

Use

With this app you can clear a payable payment manually, such as an open outgoing payment for a supplier invoice. The system usually clears these payments automatically. However, if you have paid your supplier manually without reference to an open item, you can use this app to find the matching items and clear the payment manually.

Key Features

- View open outgoing payments that you are responsible for in **My Worklist**
- Obtain a list of open items that can be used to clear the open payments
- Add or change the discount that is to be applied to each invoice
- Create residual items by entering a residual amount and assigning one or more reason codes and reference information about the business partner to residual items.

  In business configuration, you can define whether a new item is to be posted to the business partner account, or if the difference is to be cleared.
- Post an outgoing payment to a G/L account, if required with account assignment
- Post an outgoing payment on account, that is, to a customer or supplier account without reference to a specific item if clearing is not possible
- Search for open items of selected suppliers or of all suppliers by means of fuzzy logic
- Enter characteristics for profitability-related postings to assign profitability segments
- View the withholding tax that has been posted for each open item
- Create notes and attachments while posting the clearing document
- Arrange open items using an invoice reference
- Simulate the resulting journal entry
- Edit the simulated clearing document before posting it
- Save your own clearing proposals

- Clear the open payment with the selected open items that match the payment
- Clear open items for a supplier account instead for a payment
- Clear open items for down payments by selecting **Down Payments** in the **Line Item Type** field.
- Export the **Open Items** table to a spreadsheet

Supported Device Types

Desktop

Relevant Business Catalog

Accounts Payable - Operational Processing (`SAP_SFIN_BC_AP_OPERATIONS`)

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

App Extensibility: Clear Outgoing Payments

Use

You can extend the **Clear Outgoing Payments**app according to your business needs for different aspects. For this purpose, the following extensibility options are available:

Key users and developers can extend the app in the **Custom Fields and Logic** app using the following context:

- Coding Block

For Key Users and Developers

You can add fields to the following UI elements using UI adaptions at runtime:

UI Element	Business Context
Smart form	Coding Block (`FINS_CODING_BLOCK`)

For more information about how to include custom fields in Finance using different extensibility options, see Custom Fields in Finance.

For more information about how to adapt an SAP Fiori UI at runtime, see http://help.sap.com/nw75 **Application Help** > **UI Technologies in SAP NetWeaver with SAP_UI 750** > **SAP Fiori Launchpad** > **Using the Launchpad** > **Running an SAP Fiori App** > **Adapting the UI of an SAP Fiori App at Runtime** > **Making UI Adaptations** .

You can implement logic for the following enhancement options:

For more information about the extensibility app, see http://help.sap.com/s4hana <Your SAP S/4HANA release> SAP NetWeaver for SAP S/4HANA General Functions for Key Users Extensibility.

More Information

For a general description of the extensibility options and procedures of SAP Fiori apps, see Extend SAP Fiori Apps.

Country/Region-Specific Extensions

The following country/region-specific extensions are available in the **Clear Outgoing Payments** app when using a company code that is relevant in the given country/region:

Country/Region	Description of Extension
Thailand	You can add the fields **Branch Code** and **Branch Code Description** as a filter in Adapt Filters for the app and export the corresponding columns to spreadsheets.

Maintain Payment Blocks

With this app, you can display, create, edit, and delete payment blocks for currencies, banks, and countries/regions. A payment block prevents payments from being processed.

Key Features

You can use this app to check payments against payment blocks during enrichment and validation. If a payment block exists, the payment is stopped and sent to repair. In the Repair Payments app, the payment can be rejected (blocked) or processed further.

Supported Device Types

- Desktop
- Tablet

Related Information

Repair Payments

Manage Payment Blocks (Deprecated)

Use

You can use this app to set and remove payment blocks on invoices or supplier accounts. You can use various search and sorting functions to select and display invoices and view their status. The app shows additional details when you navigate to supplier data, supplier accounting documents, and purchase orders.

ℹ Note

This app (F0593) is deprecated as of SAP S/4HANA 2022 and will be deleted from the SAP Fiori launchpad in an upcoming release. We recommend you to switch to the successor app **Manage Payment Blocks** (F0593A) as soon as possible.

Key Features

- Search

  Search for open invoices by supplier, purchase order, invoice number, or journal entry

- Display
  - Display supplier accounts and open invoices and view their blocking status
  - Display open invoices with their payment details and related documents
- Payment Blocks
  - View the status of invoices and supplier accounts
  - Select supplier accounts and invoices to block them for payment or unblock them
  - Enter a payment block reason and comment

Supported Device Types

Desktop

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Related Information

Manage Payment Blocks

App Extensibility: Manage Payment Blocks

Use

You can extend the app according to your business needs for different aspects. For this purpose, the following extensibility options are available:

- **S2 View (Master List)**

  The master list shows the supplier accounts and their open payable amounts. You can do the following to extend the master list:

  - **Extend the master list items**

    You can add content (for example, additional attributes) at the beginning and at the end of the master list items.

- **Extend the end of the status section**

  You can add content to the status information.

For more information, see Extensibility of Manage Payment Blocks: Master List (S2 View).

- **S3 View (Detail List)**

  The detail list consists of the object header, the table toolbar, and the table. The object header shows the supplier account details whereas the table contains the open payable items. The table toolbar is situated between the object header and the table. It shows the total number of items on the left and, on the right, there are the sorting and personalization menus.

  You can do the following to extend the detail list:

  - **Extend the detail list object header**

    You can add content (for example, additional attributes) before and after the attributes of the object header.

  - **Extend the detail list before and after the table**

    You can add content between the table and the toolbar as well as after the table.

  - **Extend the table toolbar**

    You can add content (for example, texts or icons) at the beginning and at the end of the table toolbar.

  - **Extend the table**

    You can add additional columns and cells at the beginning and at the end of the table.

For more information, see Extensibility of Manage Payment Blocks: Detail List (S3 View).

- **ItemDetail View**

  The `ItemDetail` view shows the details of an item, for example, a supplier invoice. You can do the following to extend the view:

  - **Extend the list content**

    You can add content (for example, additional sections) at the beginning and at the end of the list content (before the **Invoice Details** and after the **Related Document** sections).

  - **Extend the ItemDetail view**

    You can add content to the `ItemDetail` view before and after the `ItemDetail` list.

  - **Extend the tab section**

    You can add content (for example, additional icons) at the beginning and at the end of the tab section.

  - **Extend the ItemDetail header data**

    You can add content (for example, additional attributes) at the beginning and at the end of the header data (before and after the attributes).

For more information, see Extensibility of Manage Payment Blocks: ItemDetail View.

Additional Extensibility Entities

Business Add-Ins (BAdIs)

The BAdI FAP_MANAGE_PAYMENT_BLOCKS is available for extensibility purposes:

You can use this BAdI to add additional fields to the supplier account and open item structures. The BAdI uses the enhancement spot ES_FAP_MANAGE_PAYMENT_BLOCKS.

Method	Use
ENHANCE_VENDOR_ACCOUNT_SET	Extend the supplier list
ENHANCE_VENDOR_ACCOUNT	Extend a supplier
ENHANCE_OPEN_ITEM_SET	Extend the item list
ENHANCE_OPEN_ITEM	Extend an item

UI Controller Hooks

To plug in and execute custom code, the following hooks are available in the controller code:

Controller	Hook	Use
ItemDetail	ext.HookOnInit (ItemDetail view)	Allows you to configure a custom initialization.
S2	ext.HookOnInit (S2 view)	Allows you to configure a custom initialization.
S2	ext.HookAfterRendering (S2 view)	Allows you to execute custom code after rendering.
S3	ext.HookOnInit (S3 view)	Allows you to configure a custom initialization.

For more information, see **SAP Library for User Interface Add-On for SAP NetWeaver** at https://help.sap.com/nw-uiaddon under **SAPUI5: UI Development Toolkit for HTML5 > Extending Apps**.

Extensibility of Manage Payment Blocks: Master List (S2 View)

Extensibility of the S2 View (Master List)

To extend the S2 view, the following extensibility entities are available on the different software layers. You have to extend each of these entities according to your specific business needs:

UI		Back End/ABAP		
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (in DDIC Structure)	Ru Re
S2 (Master List)	• MasterListItemStart (Extend beginning of master list item) • MasterListStatusEnd (Extend end of status section)	FAP_MANAGE_PAYMENT_BLOCKS_SRV	FAPO_S_PB_VENDOR_ACCOUNT_INCL	Su CL Me VE VE

UI		Back End/ABAP		
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (in DDIC Structure)	Ru Re
	• MasterListItemEnd (Extend end of master list item)			

For more information about additional extensibility options and how to extend the detail list (S3 view), see:

- App Extensibility: Manage Payment Blocks
- Extensibility of Manage Payment Blocks: Detail List (S3 View)

Extensibility of Manage Payment Blocks: Detail List (S3 View)

Extensibility of the Detail List (S3 View)

To extend the S3 view (detail list), the following extensibility entities are available on the different software layers. You have to extend each of these entities according to your specific business needs:

UI		Back End/ABAP	
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (i DDIC Structure)
S3 (Detail List)	• DetailListObjectHeaderStart (Extend beginning of object header) • DetailListObjectHeaderEnd (Extend end of object header)	FAP_MANAGE_PAYMENT_BLOCKS_SRV	FAPO_S_PB_VENDOR_ACCOUNT_
	• DetailListBeforeTable (Extend view before the detail list table) • DetailListAfterTable (Extend view after the detail list table) • DetailListTableToolbarStart (Extend beginning of toolbar) • DetailListTableToolbarEnd (Extend end of toolbar) • DetailListColumnStart (Extend beginning of list columns) • DetailListColumnEnd		FAPO_S_PB_OPEN_ITEM_INCL

UI		Back End/ABAP	
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (i DDIC Structure)
	(Extend end of list columns) • `DetailListCellStart` (Extend beginning of list detail entry) • `DetailListCellEnd` (Extend end of list detail entry)		

For more information about additional extensibility options and how to extend the master list (S2 view) and the ItemDetail view, see:

- App Extensibility: Manage Payment Blocks
- Extensibility of Manage Payment Blocks: Master List (S2 View)
- Extensibility of Manage Payment Blocks: ItemDetail View

Extensibility of Manage Payment Blocks: ItemDetail View

Extensibility of the ItemDetail View

To extend the ItemDetail view, the following extensibility entities are available on the different software layers. You have to extend each of these entities according to your specific business needs:

UI		Back End/ABAP	
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (in DDIC Structure)
`ItemDetail`	• `ItemDetailListContentStart` (Extend beginning of list content) • `ItemDetailListContentEnd` (Extend end of list content)	`FAP_MANAGE_PAYMENT_BLOCKS_SRV`	`FAPO_S_PB_OPEN_ITEM_INC`
	• `ItemDetailTabBeforeList` (Extend `ItemDetail` view before `ItemDetail` list) • `ItemDetailTabAfterList` (Extend `ItemDetail` view after `ItemDetail` list)		
	• ItemDetailTabBefore (Extend beginning of tab container)		

UI		Back End/ABAP	
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (in DDIC Structure)
	• ItemDetailTabEnd (Extend end of tab container)		
	• `ItemDetailHeaderTop` (Extends beginning of `ItemDetail` header data) • `ItemDetailHeaderBottom` (Extends end of `ItemDetail` header data)		

For more information about additional extensibility options and how to extend the master list (S2 view), see:

- App Extensibility: Manage Payment Blocks
- Extensibility of Manage Payment Blocks: Master List (S2 View)

Manage Payment Blocks

App ID: `F0593A`

With this app, you can set and remove payment blocks on invoices or supplier accounts. You can use various search, sorting, and grouping functions to select and display invoices and view their status.

Key Features

You can use this app to do the following:

- Search and filter for supplier accounts and open invoices
    - Fuzzy search

      Two search bars are available in this app. One is on the supplier list page, and the other is on the supplier object page. You can use both search bars to make fuzzy searches for supplier accounts or open invoices by supplier name, supplier ID, invoice number, journal entry number, purchase order, or external reference.

      After you enter a search term in the first search bar and choose a search result in the supplier list, the system navigates you to the supplier object page, where the second search bar is automatically filled with the same search term. You can also use the second search bar independently to search for the open invoices for a specific supplier.
    - Filter

      On the supplier list page, you can use the default filters (**Supplier**, **Company Code**, **Status**, and **Payment Block Reason**) to filter the worklist effectively. You can customize the filter bar by removing basic filters and adding more filters (**Blocked Amount**, **Company Code Currency**, and more).
- Display supplier accounts and open invoices and view their status

- Display supplier accounts and view the general information and all the open invoices for a specific supplier.
- Display open invoices with their payment details and related documents.
- View the status of supplier accounts and open invoices.

- Set and remove payment blocks
  - Choose a specific supplier account or one or more open invoices to block them for payment.

    When you set a payment block, a pop-up dialog box appears in which you can select a payment block reason and add some notes.
  - Remove payment blocks on supplier accounts and open invoices.

Supported Device Types

- Desktop
- Tablet
- Smartphone

Component for Customer Incidents

`FI-FIO-AP`

Information for Key Users

The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. To see this app's Fiori content, go to the SAP Fiori apps reference library and search for the app. Then select the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Create Incoming Invoices

Use this app to create supplier invoices or credit memos that have no purchase order in Financial Accounting. You can use it, for example, to create invoices or credit memos for utilities, office supplies, and so on.

Key Features

You can use this app to:

- Create and post supplier invoices without reference to a purchase order.
- Create and post supplier credit memos without reference to a purchase order.

ℹ Note

In certain cases, you may have several sets of withholding tax codes and types in your invoices. You must decide which of these withholding tax codes and types are relevant for each transaction. In cases where you must not calculate and post some of the proposed withholding taxes, then remove the withholding tax codes that are not relevant for that transaction.

Supported Device Types

More Information

Invoices and Credit Memos

Country/Region-Specific Fields

The following country/region-specific fields are available in the **Create Incoming Invoices** app (app ID: FB60) when using a company code that is relevant in the given country/region:

Country/Region	Description of Fields
Bulgaria	VAT document type
Brazil	**Bank Control**: Specifies the authentication for the bank or protocol, as stored in a clearing document and used to pay taxes with and without bar code. **Authentication to Attend Law**: Used for proof of payment. **Tax Form**: Specifies the payment form for each tax type.
Canada	**City of Service**: Specifies the name of the city where service is rendered. **Number of Days Spent in Canada**: Specifies the number of days you have spent in Canada. **Province/Territory of Service**: Specifies the province or territory key where service is rendered. **Travel Expenses**: Specifies the amount you have spent on travels for your business purposes.
Chile	**Purchase Transaction Type**: Specify the purchase transaction type in the header of journal entries to classify purchase tax documents individually.
Croatia	**Invoice Number**: Specifies the invoice number in long format.
Hungary	**Invoice Date**: Specifies the invoice date. **Invoice Number**: Specifies the invoice number. **Preceding Invoice Number**: Specifies the number of the preceding invoice.
Indonesia	You can enter the official document numbers of incoming invoices.
Israel	The allocation number is a unique identifier that the tax authority assigns to those invoices that meet the requirements. You can maintain the allocation number in the **Allocation No. (IL)** field, and the date when the allocation number is entered in the SAP system in the **Allocation Date (IL)** field in a journal entry at header level.
Italy	You can enter the CUP code, the CIG code, and the MGO ID.
Kazakhstan	**External Number** and **External Date**: Specify the external document number and date for documents.
Mexico	You can maintain the UUID number of your company in the **Mexico Compensation UUID for Electronic Accounting** field so that this information is included in the header of journal entries.
Peru	You use the **Official Reference Number** to identify fiscal documents in a complete and standardized way. This field consolidates four mandatory values – the document type, series number, year of issuance, and document number – into a single value, ensuring that journal entries display and store the complete reference information required for Peruvian reporting.

Country/Region	Description of Fields
Poland	You can maintain the **Transaction Date** field with the date a business operation occurred so that this information is included in the header of the document.
Portugal	You can enter the transaction type in the **Trans. Type** field to classify journal entries for SAF-T reporting. This value is filled in the **TransactionType** field of the SAF-T Accounting File and the SAF-T Integrated File.
Qatar	**Origin of Service**: The system determines the applicability of payment retention to an invoice or its line item based on its service origin: foreign, local, or exempt.
Russia	The real seller and buyer of the commission trade. **Revision Date** and **Revision Number**: Specifies the revision date and number of the document. **Original or Preceding Corrective Document Number**: Specifies the reference number of the original or preceding corrective document. **Tax Reporting Date of Revision Document**: Specifies the tax reporting date of the revision document. **External Document Date** and **External Number**: Specify the external document date and external document number. **Payment Order Date** and **Payment Order Number**: Specify the date and the number of the payment order (document that confirms the payment of the VAT) for the purchase or the sales ledger sections of the VAT return.
Serbia	**Payment Reference Model 97**: Specifies the payment source.
Singapore	**Long Header Text**: Specifies long explanations or notes with up to 50 characters which apply to the document as a whole, that is, not only for certain line items. **Permit Number**: Specifies the cargo clearance import permit number for the import business.
Slovakia	You can use the **Supplier Doc. No.** and the **Reference Invoice** fields to enter the supplier document number in accordance with country-specific requirements.
Slovenia	**Document Reference Number**: Specifies the document number in long format. Enter the document number if it exceeds the standard length.
South Korea	**Approval Number**: Specifies the electronic tax invoice ID, which has been approved by the National Tax Service. **Transfer Date of Tax Invoice**: Specifies the date on which an electronic tax invoice is transferred to and validated by the National Tax Service.
Spain	**Cadastral Reference**: Specifies the cadastral reference related to the supplier invoice. **Withholding Tax Territory**: Specifies the region where the business activity takes place.
Switzerland	You can create, change, or display down payment requests from suppliers using this app. You can enter the QR-bill data in the app during the creation of a new incoming invoice.
Thailand	**Supplier e-Tax Invoice**: Specifies whether a tax invoice is issued in the electronic format via the e-tax system in Thailand.
Turkey	**Import Declaration Registration Number**: Enter the import declaration registration number. This field is used in the input VAT declaration.

Payments

The following apps are related to payments:

- Manage Automatic Payments
- Revise Payment Proposals
- Create Single Payment
- Manage Payment Plans
- Manage Payment Media
- Post Outgoing Payments
- Monitor Payments
- Free Form Payments
- Display Status of Payment Documents

Approve Bank Payments

With this app you can review and process payment batches. You can check the payments within a batch and approve, reject, or defer individual payments or entire batches.

Features

- Search for payment batches by batch ID, company code, and house bank
- Edit the due dates for payment batches and the instruction keys for individual payments
- Submit your decisions for multiple payment batches at the same time
- Defer payments until a future date

ℹ Note

For external payment batches, some app functionality may differ.

Optional User Authentication

You have the option to enable two-factor authentication using **SAP Authentication 365** or **SAP Cloud Platform Identity Authentication** for the **Approve Bank Payments** app. If you enable two-factor authentication, the business user submitting payment batches for processing by the bank will be asked to authenticate their identity before the batches can be submitted.

Prerequisites for User Authentication

To use two-factor authentication with the **Approve Bank Payments** app, you must:

- Have an active account in either SAP Authentication 365 or SAP Cloud Platform Identity Authentication
- Make settings in Customizing, under **Financial Supply Chain Management** > **Bank Communication Management** > **Basic Settings** > **Specify Optional User Authentication**. See the Customizing activity documentation in your system for more information.

ℹ Note

SAP Authentication 365 and **SAP Cloud Platform Identity Authentication** are separate products. You must have an active account in one of those products to use two-factor authentication. For more information, see:

- SAP Authentication 365
- SAP Cloud Platform Identity Authentication

Approve in Background

You can extend this app by enabling the **Approve in Background** function. You use this function to initiate the mass approval of payment batches as a background job from within the **Approve Bank Payments** app. For information about enabling this function, see Extensibility: Approve in Background (Key User Adaptation).

Supported Device Types

- Desktop
- Tablet
- Smartphone

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

- App-Specific Implementation Information in the SAP Fiori apps reference library: https://fioriappslibrary.hana.ondemand.com/sap/fix/externalViewer/index.html?appId=F0673A

Related Information

Extensibility: Approve in Background (Key User Adaptation)
Display Bank Payment Approval Jobs

Extensibility: Approve in Background (Key User Adaptation)

This functionality allows you to initiate the mass approval of payment batches as a background job from within the Approve Bank Payments app. The key features of this functionality are:

- Continue working in the app and approving payment batches even after initiating a background job
- Limit the availability of background approval to specific users
- View the status of payment batches included in the running background job

This guide is directed at **Key Users** and assumes you have the appropriate authorizations to perform the necessary changes in your systems.

To enable this function, you must perform the following steps. The result of this procedure is that authorized users will have a new tile on their **SAP Fiori Launchpad**. This new tile will launch an enhanced version of the **Approve Bank Payments** app that allows

the user to use the approve in background function.

1. Add a New Button and Tab to the App
2. Create a New Catalog to Store the Enhanced App Tile
3. Create a New Tile to Launch the Enhanced Version of the App
4. Add a Reference to the Enhanced App in the New Catalog
5. Create a New Front-End Role and Add It to the New Catalog
6. Create a New Back-End Role and Add It to the New Catalog
7. Authorize the Enhanced App

These steps are detailed below.

1. Add a New Button and Tab to the App

In this step, you will unhide the UI elements related to the **Approve in Background** functionality. (Required role: `SAP_UI_FLEX_KEY_USER`)

1. Open the app. Enable the UI adaptation mode by clicking on your **Profile** icon and selecting **Adapt UI**.
2. Highlight the header toolbar area by moving your cursor to the region and click to use the ⊕ icon to **Add: Content**. The header toolbar is located between the filter bar and the list report. Select the checkbox for **Approve in Background** and click **OK**. Use drag and drop to change the position of the button if you choose.
3. Click **Save As**. You will be prompted to save the adapted app as a variant. Specify a **Title** for the variant, for example `Approve Bank Payments – Approve in Background`, and click **Save**.
4. You will receive an informational message with an **App ID**. Select **Copy ID and Close** to copy the ID to your clipboard and close the message.

   > **ℹ Note**
   > You will need this app ID to add a new tile to your launchpad in Step 3, so make note of it. You can return to this **Adapt UI** screen to retrieve the app ID if needed.

5. Your new variant now appears in the **Overview of App Variants**. Close the overview and click **Save and Exit**.

For more information, see Adapting UIs at Runtime (Key User Adaptation).

2. Create a New Catalog to Store the Enhanced App Tile (Optional)

In this step, you will create a new catalog where you can store the app tile for your variant. This step is optional because you can also use an existing catalog to store the tile. We recommend you create a new one.

> **ℹ Note**
> If you use an existing catalog instead of creating a new one, then whenever any steps in this overall procedure reference a new catalog, replace it with the existing catalog you want to use.

To create a new catalog:

1. In your front-end system, run transaction `/UI2/FLPD_CUST` to open your **Fiori Launchpad Designer**.

2. Use the ⊕ icon to open the creation dialog for a new catalog. Specify a **Title** and **ID**. For example, **Title**: `Background Jobs ABP`, **ID**: `SAP_EXAMPLE_BACKGROUND`.

3. Continue to overall step 3.

For more information, see Creating or Deleting Catalogs with the Launchpad Designer (Deprecated).

3. Create a New Tile to Launch the Enhanced Version of the App

In this step, you will create a new tile that allows you to launch the **Approve Bank Payments – Approve in Background** app.

1. In your front-end system, run transaction `/UI2/FLPD_CUST` to open your **Fiori Launchpad Designer**.

2. Find the new catalog you created in overall step 2, for example `SAP_EXAMPLE_BACKGROUND`.

3. On the catalog details screen, click ⊕ to add a new tile. Use the **Dynamic** template.

4. In the new tile window, enter the following details:

Field	Entry
Title	Example: Approve Bank Payments
Subtitle	Example: Approve in Background
Service URL	`/sap/opu/odata/sap/FAP_APPROVEBANKPAYMENTS_SRV/C_AbpPaymentBatch/$count/?$filter=(IsActiveEntity%20eq%20false%20or%20SiblingEntity/IsActiveEntity%20eq%20null)`
Semantic Object	`BankOutgoingPaymentCollection`
Action	`approvePaymentsBackground`

   Ensure the **Use semantic object navigation** checkbox is selected. **Save** your entries.

5. On the catalog details screen, select the **Target Mappings** tab icon and click **Create Target Mapping**. Enter the same **Title**, **Semantic Object**, and **Action** as in the previous step.

6. In **ID**, enter the **App ID** you copied in overall step 1. You can return to the **Adapt UI** screen to retrieve the app ID if needed.

7. **Save** your entries and continue to overall step 4.

For more information, see Creating and Configuring Tiles and Target Mappings.

4. Add a Reference to the Enhanced App in the New Catalog

In this step, you will add a mapping reference from the technical catalog `SAP_BASIS_TCR_T` to your new catalog.

1. In your front-end system, run transaction `/UI2/FLPD_CUST` to open your **Fiori Launchpad Designer**.

2. Search for catalog `SAP_BASIS_TCR_T` and select it.

3. With the catalog open, select the **Target Mappings** tab icon.

4. Select the row **Semantic Object**: `ApplicationJob`, **Action**: `show`

5. With the row selected, click the **Create Reference** button.

6. Find your new catalog in the search dialog and select it. For example, SAP_EXAMPLE_BACKGROUND.
7. The target reference is mapped.

> **Note**
>
> To confirm the reference is mapped successfully, you can open technical catalog SAP_BASIS_TCR_T, go to the **Target Mappings** tab and select the **Where Used** button. The reference to your new catalog will appear in the list. You can also open your new catalog, go to the **Target Mappings** tab, and see the new entry in the list of semantic objects.

For more information, see Configuring Target Mappings with the Launchpad Designer (Deprecated).

5. Create a New Front-End Role and Add It to the New Catalog

In this step, you will create a new role in your front-end system and then add a reference to that role in your new catalog.

1. In your front-end system, run transaction PFCG to open **Role Maintenance**.
2. In **Role**, enter a name for your new role, then click **Single Role**.
3. Optionally, enter a description for your new role in **Description**. **Save** your entries.
4. Go to the **Menu** tab, then **Transaction** → **SAP Fiori Launchpad** → **Launchpad Catalog**.
5. In the dialog, select the radio button for **Local Front-End Server**, then in **Catalog ID**, enter the name of the new catalog you created in overall step 2. For example, SAP_EXAMPLE_BACKGROUND.
6. Click **Continue**, then **Save** your entries.

You have now created a new front-end role and added a reference to it from your new catalog.

For more information, see Configure Roles for Catalogs.

6. Create a New Back-End Role and Add It to the New Catalog

In this step, you will create a new role in your back-end system and then add a reference to that role in your new catalog.

1. In your back-end system, run transaction PFCG to open **Role Maintenance**.
2. In **Role**, enter a name for your new role, then click **Single Role**.

   > **Note**
   >
   > The name can be the same as the role you created in your front-end system.

3. Optionally, enter a description for your new role in **Description**. **Save** your entries.
4. Go to the **Menu** tab, then **Transaction** → **SAP Fiori Launchpad** → **Launchpad Catalog**.
5. In the dialog, select the radio button for **Remote Front-End Server**, then also select then radio button for **RFC-Destination** and specify your front-end server. For example, ABCDXYZ111_T.
6. In **Catalog ID**, enter the name of the new catalog you created in overall step 2. For example, SAP_EXAMPLE_BACKGROUND. You may be prompted to sign in to your destination system.
7. Click **Continue**, then **Save** your entries.

For more information, see Configure Roles for Catalogs.

7. Authorize the Enhanced App

In this step, you will manage the authorizations for the job template used for running this background job.

1. In your back-end system, run transaction PFCG to open **Role Maintenance**.
2. Open the back-end role you created in overall step 6 and go to the **Authorizations** tab.
3. Click **Change Authorization Data**. Don't select a template if offered.
4. Click the **+Manually** button at the top of the screen. In the dialog, enter S_START in the first **Authorization Object** field and confirm.
5. Expand the subtree for **Object Class** AAAB.
6. Go to AUTHOBJNAM and enter **Change** mode within the **Action** field.
7. In the dialog, select **Application Job Catalog Entry** from the dropdown list. In **From Value**, enter SAP_FIN_BNK_MASS_APPROVE and then **Save** the entry.
8. **Save** your overall changes.
9. Click **Generate** (red and white circle) and then confirm generation.
10. Click **Status** and then confirm.

Complete the Procedure

To complete the procedure, add your new front-end role to your front-end user and your new back-end role to your back-end user. A new tile called **Approve Bank Payments – Approve in Background** will now appear on your launchpad and it will launch the enhanced version of **Approve Bank Payments**.

Related Information

Approve Bank Payments
Display Bank Payment Approval Jobs

Display Bank Payment Approval Jobs

App ID: F6617

With this app, you can monitor the status of bank payment approval jobs running in the background. The background jobs can be initiated from the **Approve Bank Payments** app after you have enabled the **Approve in Background** function. For more details, see **Related Information**.

ℹ Note

This app will only display information if you have enabled the **Approve in Background** function for **Approve Bank Payments**. For more information, see Extensibility: Approve in Background (Key User Adaptation).

Key Features

You can use this app to do the following:

- Search for background jobs initiated in the **Approve Bank Payments** app

- Display the status of bank payment approval jobs running in the background

Supported Device Types

- Desktop
- Tablet
- Smartphone

Related Information

Approve Bank Payments
Extensibility: Approve in Background (Key User Adaptation)

Skill: Approve Bank Payments

View information about payment batches and payment batch approvers.

Purpose

You use this skill to query and view payment batch information using SAP CoPilot. You can say or type your query to see information such as all payment batches for a company code, payment batches by house bank, rule, bank country, or any other filter that is available within the app.

Required Data Input

No mandatory data input.

Examples of Commands

Queries

- Show me my payment batches for company code XYZ
- Show me my payment batches with rule XYZ
- Show me my payment batches with urgent XYZ
- Show me my payment batches for house bank XYZ
- Show me my payment batches
- Show me my payment batches with creation date XYZ
- Show me my payment batches for bank name XYZ
- Show me my payment batches for account XYZ
- Show me my payment batches for bank country XYZ
- Show me approvers for my payment batch XYZ
- Show me future approvers for my payment batch XYZ

Read

- Show me my payment batch XYZ

Available Languages

English

Additional Details

For more information about skills and their availability, see the user help for SAP CoPilot at https://help.sap.com/viewer/p/SAP_COPILOT.

Manage Automatic Payments

Use

With this app you can schedule payment proposals or schedule payments directly and get an overview of the proposal or payment status. The app identifies the overdue invoices and checks whether all the required payment information is complete.

Key Features

- Create, copy, display, edit, and delete parameters.
- Schedule payment proposals or schedule payments directly.
- Automatically create payment media after scheduling payment runs. You can find the created payment media in the Manage Payment Media app.
- Create payment advices.
- Identify irregularities in invoices through integration with SAP Business Integrity Screening for SAP S/4HANA. For more information, see Integration with SAP Business Integrity Screening for SAP S/4HANA.
- Create and delete direct debit pre-notifications for processed payment proposals.
- Display and delete direct debit pre-notifications for processed payments.
- Search proposals and payments by identification, run date, creator ID, and company code.
- View payment proposal lists and payment lists.
- Check the log for scheduling proposals and payments, which shows the validity of the payment methods and the completeness of the house bank information.
- View payment items and payments in your predefined currency.
- View bank account alias, alias type, and payment system in bank details of processed payments.
- Reset exceptional payment runs, including canceled and failed SEPA direct debit pre-notification payment runs, and reschedule a payment run or create a new one, depending on the updated payment run status.
- Specify whether a payment batch should be created automatically when using the Bank Communication Management (BCM) solution.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

About the New Output Management Feature

The following table lists the support for the output channels for payment advices:

Output Channel for Payment Advices	Supported
XML (Integration with Ariba)	Yes Launch transaction SM30 and display view APOC_I_OUTP_TYPV. The following entry is used to achieve this feature: **Application Object Type** / **Output Type** / **Text** FFO_PAYM_ADV / PAYM_ADV_CXML / Payment Advice via Ariba Apply SAP Note 2248229 to install the BRFplus files for the output of payment advices.
Print/Email	Yes

Supported Device Types

Desktop

Navigation Targets

The app enables users to access other apps directly (for example to display detailed information).

Note

These linked apps have to be already available in your system landscape or you have to implement them along with this app.

- Revise Payment Proposals

Component for Customer Incidents

FI-FIO-AP

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Related Information

Integration with SAP Business Integrity Screening for SAP S/4HANA
App Extensibility: Manage Automatic Payments
Configuring the Output of Payment Proposal Lists and Payment Lists

Integration with SAP Business Integrity Screening for SAP S/4HANA

Use

SAP Business Integrity Screening for SAP S/4HANA is optionally integrated in the creditor and debtor payment runs (transaction `F110` and the **Manage Automatic Payments** app). It checks the FI invoice documents in a payment proposal for irregularities. Investigators can review the alert on the problem in SAP Business Integrity Screening for SAP S/4HANA and either release the payment or confirm that there is a problem.

Prerequisites

- SAP Business Integrity Screening for SAP S/4HANA is co-deployed with SAP S/4HANA. SAP Business Integrity Screening for SAP S/4HANA is not part of SAP S/4HANA, but part of the add-on SAP Assurance and Compliance Software for SAP S/4HANA, for which you need a separate license.
- You have activated the integration using the Customizing activity **Activate the Integration Scenario** under **Integration with Other SAP Components** > **Business Integrity Screening** > **Integration in the Payment Run**. You use this Customizing activity to specify whether you want SAP Business Integrity Screening for SAP S/4HANA to check for irregularities in the client in which you are logged on.
- You have activated the standard implementation of the **Schedule Report After Payment Run** Business Add-In (BAdI) under **Integration with Other SAP Components** > **Business Integrity Screening** > **Integration in the Payment Run** > **Business Add-Ins (BAdIs)**. You use this BAdI to submit payment runs to SAP Business Integrity Screening for SAP S/4HANA for examination.

Features

If SAP Business Integrity Screening for SAP S/4HANA finds a problem with a document in a payment proposal, it applies a payment block to the document. The document then has the item indicator 096 in transaction `F110`; it has the error ID 096 in the **Manage Automatic Payments** app. The item indicator (error ID) marks for an exception for the item. You cannot pay a document with this status. If the document is included in another payment proposal, a duplicate alert will not be created.

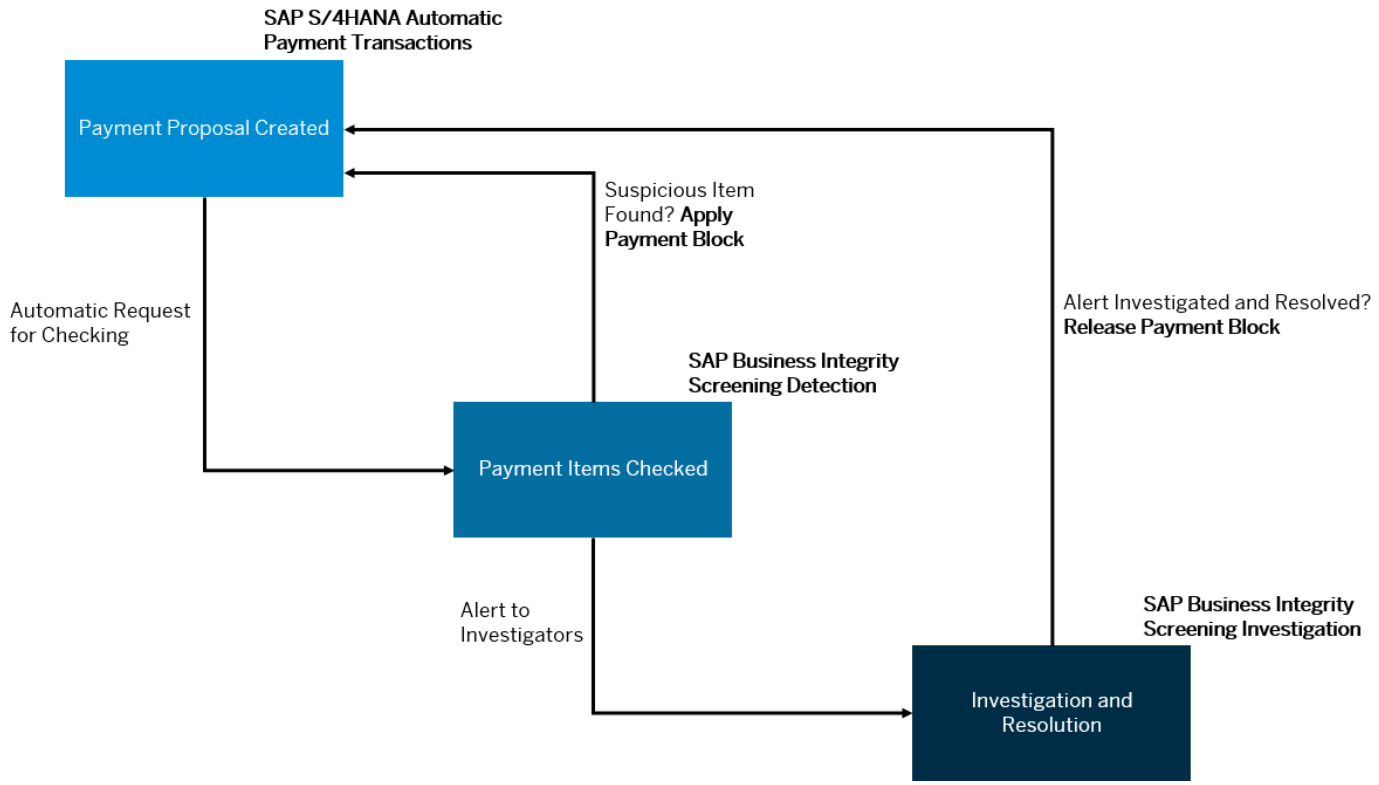

ℹ Note

When a document has item indicator (error ID) 096, you can still release the payment proposal that contains the document. Only the document, which is blocked, will not be included in further processing.

The block on the document can be lifted only by closing the alert in SAP Business Integrity Screening for SAP S/4HANA. You need to contact your investigator and ask them to check the document. The investigator can either release the document or confirm that there is a problem. If the investigator closes the alert as false alarm or closes it without investigation, they release the document for payment. The item indicator (error ID) changes to 097 and the payment block is removed. You can then run the payment proposal and pay the document.

Process

The following figure shows the process flow for this integration scenario:

Integration with SAP Business Integrity Screening for SAP S/4HANA

For more information about the process, see Integration in the Payment Run in SAP S/4HANA.

App Extensibility: Manage Automatic Payments

Use

You can extend this app according to your business needs for different aspects. For this purpose, the following extensibility options are available:

- Customer Fields

  You can add customer fields to the **Manage Automatic Payments** app.

Customer Fields

To add a customer field to the app, the extensibility entities listed below are available on the different software layers. You have to extend each of these entities according to your specific business needs:

UI		Back End/ABAP		
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (in DDIC Structure)	Runtime: Superclass
S1.view.app.xml	extProposalListColumns	PaytProposal	FAP_SPP_S_PAYTPROPOSAL_INCL	**Superclass:** CL_FAP_ **Method:** • PAYTPROPOS • PAYTPROPOS

Further Extensibility Entities

Extension Points

If there are additional fields available in the OData service, you can display these fields on the UI. For more information about extension points, see Extend SAP Fiori Apps.

UI Controller Hooks

If there are additional UI controller hooks available in the controller code, you can extend the UI controller code. For more information about UI controller hooks, see Extend SAP Fiori Apps.

More Information

For a general description of the extensibility options and procedures of SAP Fiori apps, see Extend SAP Fiori Apps.

Adding Custom Fields to Payment List Forms

Configuring the Output of Payment Proposal Lists and Payment Lists

To meet your business needs for flexible viewing of payment proposal lists and payment lists, SAP provides rules to make the relevant settings. This topic explains how to configure the output of these lists for the **Manage Automatic Payments** app.

What Is Included in the Lists?

A payment proposal list is a PDF document that lists the items that are to be paid in a payment run. A payment list is a PDF document that lists the items that have been paid in a payment run. By default, the same form template is used to generate a payment proposal list and the corresponding payment list. The two lists include the following information:

- Payment overview

  Shows the total payment amount, the total deduction amount, the total number of payments, and the total number of paid items.

- Payment identification

  Shows the run date, the identification, and the paying company code.

- Payment details

  Shows each item including the payment number, the bank account, the payment method, the payment currency, and the payment amount.

- Company logo

  Shows the company logo in the top-right corner if you have entered this information.

How to View a Payment Proposal List?

To view a payment proposal list in the **Manage Automatic Payments** app, proceed as follows:

1. Switch to the **Proposals Processed** tab.
2. Search for the payment proposal that you want to view.
3. Open the proposal from the search result.

   The proposal is then opened in the **Revise Payment Proposals** app.
4. Choose the **Export to PDF** icon above the **Payments** table.

You can then download or print the list from your browser as needed.

How to View a Payment List?

To view a payment list in the **Manage Automatic Payments** app, proceed as follows:

1. Switch to the **Payments Processed** tab.
2. Search for the payment that you want to view.
3. Open the payment from the search result.
4. Switch to the **PAYMENTS** tab.
5. Choose the **Export to PDF** icon above the **Payments** table.

You can then download or print the list from your browser as needed.

How to Create a Custom List?

To use a custom form template instead of the default one delivered by SAP, `FIN_FO_PAYM_LIST_V2`, for generating payment proposal lists or payment lists, proceed as follows:

1. Create a custom form template using the **Maintain Form Templates** app.

   The name of a custom form template must start with the letter Z. For more information about this app, see Maintain Form Templates.
2. Choose to use the custom form template in the Customizing activity **Define Business Rules for Output Parameter Determination**.

   a. Launch the Customizing activity **Define Business Rules for Output Parameter Determination** under **Cross-Application Components** > **Output Control**.

   b. Select **Payment List** from the **Show Rules for** dropdown list.

c. Select **Form Template** from the **Determination Step** dropdown list.

d. Enter edit mode, select the downward arrow in the **Form Template** column for the corresponding table entry, and choose **Direct Value Input** from the context menu.

In the **Role** column, **PL** refers to payment list while **PP** refers to payment proposal list.

e. Enter your custom form template in the input field that appears and choose **OK**.

f. Choose **Activate** to save your changes.

Adding Custom Fields to Payment List Forms

You can create and add custom fields to the items for payment in payment list forms.

You use the **Custom Fields and Logic** app to add custom fields.

You use the Business Add-In (BAdI) `FINS_PAYMENT_LIST_PRINT_ITEM` (**Payment List Output Item Adaption**) to implement your custom logic for filling in the values for the custom fields added to the items for payment.

Procedure

The entire process consists of the following steps:

1. Create a custom field.

a. Open the **Custom Fields and Logic** app.

> **Note**
> To be able to access this app, your user must be assigned a role that has the authorization as defined in the business catalog **Extensibility** (`SAP_BASIS_BC_EXT`).

b. Choose + (**Create**) on the **Custom Fields** tab to create a new field.

c. Fill out the dialog box as explained in the following table and then choose **Create**:

Field	Explanation
Business Context	To add a custom field to the items for payment, select **Finance: Payment List Item**.
Label	Enter a descriptive label for the field.
Identifier	Enter a technical name for the field. The prefix is automatically specified.
Tooltip	Enter the descriptive text that you want to appear in a pop-up window when you hover your mouse over the field.
Type	Enter the data type of the field.

2. Enable the custom field for use in the payment list form template to which you want to add the field.

a. Search for and open the custom field you just created in the **Custom Fields and Logic** app.

b. Switch to the **Form Templates** tab.

c. Enable usage for the desired form template.

d. Save your changes.

3. Implement your custom logic for the field.

a. Return to the landing page of the **Custom Fields and Logic** app.

b. Switch to the **Custom Logic** tab.

c. Choose + (**Create**) to create an enhancement implementation.

d. Fill out the dialog box as explained in the following table and then choose **Create**:

Field	Explanation
Business Context	Select the same business context that you selected in step 1-c.
BAdI Description	Select the only BAdI available in the drop-down list.
Implementation Description	Enter a description for the implementation.
Implementation ID	This field is filled out automatically.

e. Search for and open the implementation you just created.

f. Adapt the code in the **Draft Logic** section to fill in the value for the custom field.

g. Choose **Save Draft** in the bottom-right corner of the app.

h. Test the implementation and finally publish it.

4. Download the form template to which the custom field was added.

a. Open the **Maintain Form Templates** app.

b. Switch to the **Predelivered Templates** tab.

c. Enter `FIN_FO_PAYM_LIST_V2` in the **Form Template Name** filter and press Enter.

d. Open the form Template.

e. Choose **Download** in the **Original Language** filed in the **Details** section.

> **Note**
>
> Downloading and later on adapting this form template only adds the custom field to the original language version of the template. If you want the custom field to appear in other language versions, download the corresponding templates from the **Available Translations** section and adapt them as well.

5. Download an XML file for providing test data for the downloaded form template.

For information about how to download this file, see SAP Note 2985325.

6. Add the custom field to the form template.

a. Extract the downloaded ZIP file for the form template.

b. Open the extracted XDP file in Adobe LiveCycle Designer.

c. Add the custom field to the form template and bind data to the field.

The following table shows where you can find the custom field:

Data View	Includes
`PaymentNode`under `Items`	Custom fields for items in payment

d. Test the adapted template using the data provider XML file you downloaded in step 5 to ensure that the custom field works.

e. Save your changes.

7. Upload the adapted form template.

a. Open the **Maintain Form Template** app.

b. Choose **New** to create a new form template.

Fill out the dialog box as explained in the following table and then choose **Create**:

Field	Explaination
Form Template Name	Enter a name for the new form template.
Language	Select the same language in which you downloaded the form template in step 4-e.
Select Form Template File	Select the form template for upload.
Data Source	Select **FDP_FFO_PAYM_LIST_SRV**.
Form Type	Leave the default selection **Content** as it is.

8. Enable the uploaded form template for generating payment list forms.

a. In your configuration environment, search for the customizing activity **Assign Form Templates** and excute it.

b. Choose **New Entries**.

c. Create the new entry as follows and then choose **Save**.

Application Object Type	Output Type	Form Type	Form Template ID
`FFO_PAYM_LIST`	`PAYM_LIST`	`Output Forms (Gateway interface)`	Enter a technical name for the template.

9. Specify to use the uploaded form template for generating payment list forms.

a. Open the **Output Parameter Determination** app.

> **Note**
>
> To be able to access this app, your user can create a reference from the technical catalog of the app (**SAP Cross Application Common**: `SAP_TC_CA_COMMON_BE_APPS`) to your business catalog.

b. Select **Payment List** from the **Show Rules for** dropdown list and **Form Template** from the **Determination Step** dropdown list.

c. Choose **Edit** in the **Maintain Business Rules** section to enter change mode.

d. Choose the default form template to be replaced in the **Form Template** column.

e. Enter the technical name that you specified for the uploaded form template in step 8-e.

f. Choose **OK** to save your changes.

Configuring the Output of Payment Advice Forms

To meet your business needs for flexible output of payment advice forms, SAP provides rules to make the relevant settings. This topic explains how to configure the output of payment advice forms for the **Manage Automatic Payments** app.

Output Item Statuses

In the **Manage Automatic Payments** app, if you open a payment and switch to the **Output Items** tab, you can find a list of output requests. The following table lists the statuses an item might be in and what you can do in each status:

Status	Description	Possible Action from This Status
In Preparation	The initial status after an output item has been created. All fields are editable.	• Preview item • Download item
To Be Output	Form has been marked for output. The dispatch time determines when the output is performed.	• Preview item • Download item
Pending	The output has been processed and is waiting for an update from the specified channel.	• Set status to completed • Show application log • Preview item • Download item
Completed	Output is completed. This is the final status.	• Show application log • Preview item • Download item
Error	Errors have occurred during the output process. Details are available in the application log.	• Set status to completed • Show application log • Retry sending form

Procedure

To configure the output of payment advice forms, proceed as follows:

1. Open the **Output Parameter Determination** app.

To be able to see this app, you need to be assigned a role that includes the **Output Management - Output Control** (SAP_CA_BC_OC_PC) business catalog.

2. Select **Payment Advice** from the **Show Rules for** dropdown list.

3. Select an entry from the **Determination Step** dropdown list and make the settings as described in the following table:

Determination Step	Explanation
Output Type	You define the output type to use for the app. An output type defines the output parameters for the payment advice forms. The following output types are delivered by SAP. You can change the dispatch time if necessary. • PAYM_ADV • PAYM_ADV_CXML • PAYM_ADV_EDI
Receiver	Check whether the settings are as follows: **Check Type** / **Sending Company Code** / **Paying Company Code** / **Supplier** **=PAYM_ADV (Payment Advice)** / / / **is not initial** **=PAYM_ADV_CXML (Payment Advice via Ariba)** / / / **is not initial** **=PAYM_ADV_EDI (Payment Advice via EDI channel)** / / / **is not initial**
Channel	You assign the output channels to use for the app. An output channel determines how the payment advice forms are delivered. The entries with PAYM_ADV, PAYM_ADV_CXML and PAYM_ADV_EDI as the output type are delivered by SAP. If you add more entries, you can filter for sending company code, paying company code, and supplier.
Printer Settings	You create a print queue to manage the printing of forms. A default print queue, DEFAULT, is delivered by SAP. However, SAP recommends that you create your own print queue so that your forms are not mixed with others. If you add more entries, you can filter for sending company code and paying company code.
Email Settings	You specify the email address for sending payment advice forms. The email template FFO_PAYM_ADVICE_EMAIL_TEMPLATE is delivered by SAP. You cannot change its content. Please enter

Determination Step	Explanation
	a valid email address as the sender email.
Email Recipient	You specify the email address for receiving payment advice forms. When payment advice forms are created, the **Output Parameter Determination** app first looks for the email address that you enter in this determination step. If no email address is entered, it then retrieves the email address entered in the master data of the business partner. For better system performance, SAP recommends that you leave this determination step empty so that the email address in the master data is retrieved and used for receiving payment advice forms. To enter an email address in the master data of a business partner, proceed as follows: a. Open the **Maintain Business Partner** app. b. Find and open a supplier or a customer. c. Select the supplier (Financial Accounting) role or the customer (Financial Accounting) role in the **Display in BP role** drop-down list. d. Choose **Company Code** on the ribbon. e. Switch to the **Vendor: Correspondence** tab or the **Customer: Correspondence** tab. f. Switch to change mode by choosing **More** on the ribbon and then selecting **Business Partner Display ↔ Change** from the context menu. g. Enter the email address in the **Clrk's internet add.** field in the **Correspondence** section.
Form Template	You specify the form for creating payment advice forms. The form template `FIN_FO_PAYM_ADVICE` is delivered by SAP. You cannot change its content. If you want to use your own templates, proceed as follows: a. Download the template delivered by SAP from the Maintain Form Templates app. To be able to see this app, you need to be assigned a role that includes the Output Management - Form Templates (`SAP_CORE_BC_OM_FT`) business catalog. b. Make your changes to the template. c. Upload the template to the system using the Maintain Form Templates app. d. Specify this template in this Form Template determination step in the Output Parameter Determination app.
Output Relevance	Check whether the settings are as follows:

Determination Step	Explanation
	<table><tr><th>Output Type</th><th>Relevance Indicator</th></tr><tr><td>=PAYM_ADV (Payment Advice)</td><td>X (true)</td></tr><tr><td>=PAYM_ADV_CXML (Payment Advice via Ariba)</td><td>X (true)</td></tr><tr><td>=PAYM_ADV_EDI (Payment Advice via EDI channel)</td><td>X (true)</td></tr></table>

Adding Additional Email Recipients for Payment Advices

You can use the **Addition of Email Recipients** Business Add-In (BAdI) to implement custom logic that enables sending of payment advice outputs to multiple email addresses, including `TO` and `CC` recipients. The custom logic is called during output parameter determination to determine the required email recipients.

Business Background

By default, payment advices in output channel `EMAIL` can only be sent to one email recipient per output item. The email address that the payment advices are sent to depends on the settings in the **Output Parameter Determination** app as described in Configuring the Output of Payment Advice Forms.

However, you may want payment advices to be sent automatically to more than one direct recipient (email type code `TO`), or to be copied to other recipients (email type code `CC`) based on the conditions that you have defined for the output items.

You can add additional email recipients by implementing custom logic using the BAdI **Addition of Email Recipients** (`APOC_ADD_EMAIL_RECIPIENTS`) and maintain the recipients in the **Email Recipient** determination step. During payment advice output, the system calls the custom logic and determines recipient email addresses based on your receiver email address settings.

Create Your Custom Logic

To create your custom logic, proceed as follows.

1. In the app, choose **Create** to create a new implementation.

   Custom Logic

   > **Note**
   > To be able to access this app, your user must be assigned a role that has the authorization as defined in the **Extensibility** (`SAP_CORE_BC_EXT`) business catalog.

2. Choose **Finance: Payment Advice** as the business context and select the BAdI mentioned above as the extension point.
3. Enter `FFO_PAYM_ADV` as filter value.
4. Enter a description and ID for the implementation.
5. Review the details of the implementation. If no changes are required, create and publish it.

6. Open code editor of the implementation.

7. Write your custom logic and publish.

Example

The following sample code shows you how you can use the BAdI to read email address information maintained in supplier master data and assign the email addresses to recipients with the email type code TO.

Sample Code

```
DATA: ls_additional_email_recipient LIKE LINE OF additionalemailrecipients.

SELECT addressid
   FROM i_buspartaddress  WITH PRIVILEGED ACCESS
   WHERE businesspartner = @recipient
   INTO TABLE @DATA(lt_address_id).

IF lt_address_id IS NOT INITIAL.
  " Get Email Address
  SELECT emailaddress
  FROM i_addressemailaddress_2  WITH PRIVILEGED ACCESS
   FOR ALL ENTRIES IN @lt_address_id
  WHERE addressid  = @lt_address_id-addressid
  INTO TABLE @DATA(lt_emailaddress) .

  LOOP AT lt_emailaddress ASSIGNING FIELD-SYMBOL(<fs_emailaddress>).
    ls_additional_email_recipient-outputrequestitememailrole = 'TO'.
    ls_additional_email_recipient-outputrequestitememailaddress = <fs_emailaddress>-emailaddress
    APPEND ls_additional_email_recipient TO additionalemailrecipients.
  ENDLOOP.

ENDIF.
```

The following sample code shows you how you can use the BAdI to read email address information maintained in supplier master data and assign the email addresses to recipients with the email type code TO and CC.

Sample Code

```
DATA: ls_additional_email_recipient LIKE LINE OF additionalemailrecipients.
DATA: ls_supplier TYPE i_suppliercompany.
DATA: ls_customer TYPE i_customercompany.

IF recipientrole = 'H'.    " Supplier
  SELECT SINGLE * INTO @ls_supplier
                  FROM i_suppliercompany
                 WHERE supplier = @recipient AND
                       companycode = @outputcontrolapplicationobject+15(4).

  IF ls_supplier-accountingclerkinternetaddress IS NOT INITIAL.
    " Fill To email address from BP master data
    CLEAR ls_additional_email_recipient.
    ls_additional_email_recipient-outputrequestitememailrole = 'TO'.
    ls_additional_email_recipient-outputrequestitememailaddress = ls_supplier-accountingclerkint
```

```
      APPEND ls_additional_email_recipient TO additionalemailrecipients.

      " Fill the hardcode CC email address
      CLEAR ls_additional_email_recipient.
      ls_additional_email_recipient-outputrequestitememailrole = 'CC'.
      ls_additional_email_recipient-outputrequestitememailaddress = 'hardcode_supplier_cc@sap.com'
      APPEND ls_additional_email_recipient TO additionalemailrecipients.
    ENDIF.
  ELSEIF recipientrole = 'S'.    " Customer
    SELECT SINGLE * INTO @ls_customer
                        FROM i_customercompany
                       WHERE customer = @recipient AND
                             companycode = @outputcontrolapplicationobject+15(4).

    IF ls_customer-accountingclerkinternetaddress IS NOT INITIAL.
      " Fill To email address from BP master data
      CLEAR ls_additional_email_recipient.
      ls_additional_email_recipient-outputrequestitememailrole = 'TO'.
      ls_additional_email_recipient-outputrequestitememailaddress = ls_customer-accountingclerkint
      APPEND ls_additional_email_recipient TO additionalemailrecipients.

      " Fill the hardcode CC email address
      CLEAR ls_additional_email_recipient.
      ls_additional_email_recipient-outputrequestitememailrole = 'CC'.
      ls_additional_email_recipient-outputrequestitememailaddress = 'hardcode_customer_cc@sap.com'
      APPEND ls_additional_email_recipient TO additionalemailrecipients.
    ENDIF.
  ENDIF.
```

Set Up Output Parameter Determination to Call the Custom Logic

To configure additional email addresses for payment advice, proceed as follows.

1. In the **Output Parameter Determination** app, select **Payment Advice** from the **Show Rules for** dropdown list and **Email Recipient** from the **Determination Step** dropdown list.

   > **ℹ Note**
   >
   > To be able to access this app, your user must be assigned a role that has the authorization as defined in the **Output Management - Output Control** (`SAP_CA_BC_OC_PC`) business catalog.

2. Insert a new row in the decision table.

3. Choose **PAYM_ADV (Payment Advice)** as output type, and select an email type code (for example, **TO (To)** for direct recipients).

   > **→ Remember**
   >
   > Email type code is mandatory.

4. In the **Email Address** field, choose **Select Expressions** from the dropdown list.

5. In the dialog box that opens, apply the following search criteria and trigger the search:

   - **Application Name**=`OPD_APOC_SYSTEM`

- Expression Type=Constant

6. In the search result, select the Add email recipients from custom logic constant and confirm.

7. Activate your changes.

During output parameter determination, the system will call the Addition of Email Recipients BAdI for each row that you have entered to determine additional email recipients.

→ Tip

Note that all email type codes that you want to fill via the BAdI need an entry here. For example, if the BAdI returns a CC address and there is no row for CC in the table, the system ignores this returned address.

Adding Custom Fields to Payment Advice Forms

This topic describes how to add custom fields to payment advice forms. You can add them to the payment advice header and to the items for payment.

You use the Custom Fields and Logic app to add custom fields.

You use the Business Add-In (BAdI) FBL_PAYM_ADV_PRINT_HEADER (Output Printing Adaptation of the Payment Advice Header) to implement your custom logic for filling in the values for the custom fields added to the payment header data.

You use the BAdI FBL_PAYM_ADV_PRINT_ITEM (Output Printing Adaptation of the Payment Advice Item) to implement your custom logic for filling in the values for the custom fields added to the items for payment.

Procedure

The entire process consists of the following steps:

1. Create a custom field.

   a. Open the Custom Fields and Logic app.

   ### ⓘ Note

   To be able to access this app, your user must be assigned a role that has the authorization as defined in the business catalog Extensibility (SAP_CORE_BC_EXT).

   b. Choose + (Create) on the Custom Fields tab to create a new field.

   c. Fill out the dialog box as explained in the following table and then choose Create:

Field	Explanation
Business Context	▪ To add a custom field to the payment header data, select Finance: Payment Advice.

Field	Explanation
	▪ To add a custom field to the items for payment, select Finance: Payment Advice Item.
Label	Enter a descriptive label for the field.
Identifier	Enter a technical name for the field. The prefix is automatically specified.
Tooltip	Enter the descriptive text that you want to appear in a pop-up window when you hover your mouse over the field.
Type	Enter the data type of the field.
Length	Enter the maximum number of alphanumeric characters allowed for the field.

2. Enable the custom field for use in the payment advice form template to which you want to add the field.

    a. Search for and open the custom field you just created in the Custom Fields and Logic app.

    b. Switch to the Form Templates tab.

    c. Enable usage for the desired form template.

    d. Save your changes.

3. Implement your custom logic for the field.

    a. Return to the landing page of the Custom Fields and Logic app.

    b. Switch to the Custom Logic tab.

    c. Choose + (Create) to create an enhancement implementation.

    d. Fill out the dialog box as explained in the following table and then choose Create:

Field	Explanation
Business Context	Select the same business context that you selected in step 1-c.
BAdI Description	Select the only BAdI available in the drop-down list.
Implementation Description	Enter a description for the implementation.
Implementation ID	This field is filled out automatically.

    e. Search for and open the implementation you just created.

    f. Adapt the code in the Draft Logic section to fill in the value for the custom field.

    g. Choose Save Draft in the bottom-right corner of the app.

    h. Test the implementation and finally publish it.

4. Download the form template to which the custom field was added.

    a. Open the Maintain Form Templates app.

b. Switch to the **Predelivered Templates** tab.

c. Enter `FIN_FO_PAYM_ADVICE` in the **Form Template Name** filter and press Enter.

d. Open the form template.

e. Choose **Download** in the **Original Language** field in the **Details** section.

> **Note**
>
> Downloading and later on adapting this form template only adds the custom field to the original language version of the template. If you want the custom field to appear in other language versions, download the corresponding templates from the **Available Translations** section and adapt them as well.

5. Download an XML file for providing test data for the downloaded form template.

6. Add the custom field to the form template.

a. Extract the downloaded ZIP file for the form template.

b. Open the extracted XDP file in Adobe LiveCycle Designer.

c. Add the custom field to the form template and bind data to the field.

The following table shows where you can find the custom field:

Data View	Includes
`ToPaymentPreparedData`	Custom fields for payment header data
`ToPaymentPaiditem`	Custom fields for items in payment

d. Test the adapted template using the data provider XML file you downloaded in step 5 to ensure that the custom field works.

e. Save your changes.

7. Upload the adapted form template.

a. Open the **Maintain Form Templates** app.

b. Choose **New** to create a new form template.

Fill out the dialog box as explained in the following table and then choose **Create**:

Field	Explanation
Form Template Name	Enter a name for the new form template.
Language	Select the same language in which you downloaded the form template in step 4-e.
Select Form Template File	Select the form template for upload.
Data Source	Select **FDP_FFO_PAYM_ADVICE_SRV**.
Form Type	Leave the default selection **Content** as is.

8. Enable the uploaded form template for generating payment advice forms.

a. Launch the Customizing activity Assign Form Templates under Cross-Application Components > Output Control.

b. Choose New Entries.

c. Create the new entry as follows and then choose Save:

Application Object Type	Output Type	Form Template ID
FFO_PAYM_ADV	PAYM_ADV	Enter a technical name for the template.

9. Specify to use the uploaded form template for generating payment advice forms.

a. Open the Output Parameter Determination app.

> **Note**
> To be able to access this app, your user must be assigned a role that has the authorization as defined in the business catalog Output Management - Output Control (SAP_CA_BC_OC_PC).

b. Select Payment Advice from the Show Rules for dropdown list and Form Template from the Determination Step dropdown list.

c. Choose Edit in the Maintain Business Rules section to enter change mode.

d. Choose the default form template to be replaced in the Form Template column.

e. Enter the technical name that you specified for the uploaded form template in step 7-b.

f. Choose OK to save your changes.

Payment Reason for Storing Purpose Codes

Payment reason stores purpose codes of house bank and payee bank and is assigned into each payment transaction, which is populated into the payment medium file as the instruction for the payee bank.

Prerequisites

You have defined payment reasons and assigned purpose codes to each in customizing for Financial Accounting under Accounts Receivable and Accounts Payable > Business Transactions > Outgoing Payments > Automatic Outgoing Payments > Payment Media > Data Medium Exchange > Define Payment Reasons.

Business Process

When a cross-bank payment is made, purpose codes from the house bank country or region and payee bank country or region are required to be provided in the payment file, due to regulatory requirements of local authorities. Payment reason embodies the purpose codes from both bank countries or regions and is assigned into each payment transaction, which is populated into the payment medium file during the payment run. You can define reasons for your payments to classify the type of the payment transaction, which includes, among others, salary payment, purchase of goods, purchase of services.

Payment reason could be maintained in the business partner master data not only on the general data level, but also on the company code data level as the default value for routine usage. In the meantime, a specific payment reason could be given into an individual business transaction based on business needs, for example, when an invoice or other business document is posted.

When a payment document is created via the **Manage Automatic Payments** app, payment reason will be determined and filled into the payment document. Invoices of different payment reason are grouped into different payment documents. Since payment reason could be specified both during the business transaction and when maintaining master data, the priority for determining payment reason should be considered. Payment reason will be determined based on the following sequence:

1. Payment reason specified during business transaction
2. Payment reason maintained in business partner company code data
3. Payment reason maintained in business partner general data

Once the payment reason is determined in the payment documents of a payment proposal, the revision of payment reason in the payment documents could happen for special reasons, such as wrong input and payment reason update. You can choose a different payment reason by choosing **Edit Payments**, or when you unblock a blocked payment or reallocate a payment item in the **Revise Payment Proposals** app.

ℹ Note

Currently, the revison of payment reason is supported only in the SAP Fiori applications.

During the final payment run, based on the payment reason entries maintained in the **Define Payment Reasons** customizing activity and the actual payment reasons, the sending bank country or region and receiving bank country or region information in each payment documents and the purpose codes of sending bank country or region and receiving bank country or region will be filled into the payment medium structure and transferred into the payment file.

ℹ Note

You can also define payment reasons for payment requests created via the **Process Free Form Payments** and **My Free Form Payments** apps.

In the **Automatic Payment Transactions for Payment Requests** app (F111), after a payment proposal is generated, payments based on payment requests with different payment reasons are grouped into different payment documents. You can edit the proposal to change the payment reason of a payment document, or the payment reason of an individual payment request when reallocating the payment request to a new payment document.

Bank Account Alias

Bank account alias is used as an alternative representation of a bank account. When making a payment to a business partner, the accounts payable accountant simply needs to provide the bank account alias maintained for the business partner, based on which the financial institution can identify the target account.

Business Process

Before bank account alias can be used for transaction, payment system, bank account alias, alias type and relevant information for the business partner are required to be maintained first. For more information about maintaining alias relevent information, see Bank Account Aliases.

In addition, as bank account aliases are dependent on the countries or regions of transaction and payment systems employed, relevant information need to be maintained in the configuration activity **Set Up Payment Methods for Each Country/Region for Payment Transactions** and **Set Up Payment Methods per Company Code for Payment Transactions**.

When creating an invoice, bank account alias can be retrieved via the field **Partner Bank Type** into in the document. During the payment run, bank account alias relevant information (payment system, alias type, alias) are determined into the payment documents based on **Alias Required** and **Permitted Payment System** specified in the above mentioned configuration activity for payment methods. In the **Manage Automatic Payments** app or SAP GUI transaction `F110`, viewing the bank account alias, alias type and payment system of processed payments in the bank details is supported.

Modifying the bank account alias of scheduled payment proposals is possible in the **Revise Payment Proposals** app by choosing **Edit Payments**, **Unblock** or **Reallocation**. Finally, bank account alias relevant information will be populated into the payment medium file as reference for the relevant financial institution.

Apart from the above mentioned transaction or Fiori app, bank accounts alias is supported in the following transactions:

- Transaction `FIBLFFP` (**Free Form Payment**)
- Transaction `FIBLAPOP` (**Vendors-Payment Request**)
- Transaction `FIBLAROP` (**Customers-Payment Request**)
- Transaction `OT81` (**Repetitive Codes**)
- Transaction `F111` (**Automatic Payment Transactions for Payment Requests**)

Bank account alias is also available on the data provider of the following forms:

- Payment List
- Payment Accompanying Sheet

Automatic Determination of Bank Subaccounts

This topic describes why the bank subaccount for posting a payment is automatically determined if you assign a bank reconciliation account to house bank accounts. It also introduces what settings you need to make to achieve this purpose.

Assigning Reconciliation Account to House Bank Accounts

You can reuse a bank reconciliation account and assign it to multiple house bank accounts. This helps you reduce the number of G/L accounts significantly and reduce the effort required to update your chart of accounts. To this bank reconciliation account, you can assign a bank subaccount, also known as a bank clearing account, to each of your payment methods. For more information, see Defining House Bank Accounts and section **Assign a Bank Reconciliation Account** in Assigning G/L Accounts to House Bank Accounts.

If you adopt this approach instead of assigning a balance sheet account to each house bank account, when you make a payment using, for example, the **Manage Automatic Payments** app or the **Create Single Payment** app, the bank subaccount for posting the payment can be automatically determined.

In the **Set Up Bank Determination for Payment Transactions** Customizing activity, you specify which bank subaccount should be used for a given combination of paying company code, house bank, payment method, currency, and account ID. When the following conditions are met, the **Bank Subaccount** field for a bank account is grayed out and cannot be specified as its value is automatically derived:

- The bank subaccount is linked to a bank reconciliation account in the Manage G/L Account Master Data app.
- The payment method is enabled for payment processing using the bank reconciliation account.

The Customizing activity can be found via the following path: **Financial Accounting** > **Accounts Receivable and Accounts Payable** > **Business Transactions** > **Outgoing Payments** > **Automatic Outgoing Payments** > **Payment Method/Bank Selection for Payment Program**.

ℹ Note

When a bank reconciliation account is activated for a house bank account, the bank subaccount is derived by the account symbol. You must ensure the bank subaccount derived by the account symbol is properly created in the G/L account master data, and assigned into its bank reconciliation account. Otherwise, the payment run for the payment request program does not create payment document for the payment request.

Procedure

To do this, compete the following steps:

1. Assign a bank subaccount to an account symbol.

   An account symbol is a key that can be used to group accounts from different charts of accounts. You use an account symbol to link a bank subaccount to a payment method.

   In the **Make Global Settings for Electronic Bank Statement** Customizing activity, make the following settings:

   a. Create an account symbol.

   b. Select the **SIP Relev.** (Self-Initiated Payment) checkbox for the account symbol to enable it for use in automatic payment programs.

   c. Assign a G/L account to the account symbol.

   You can find the Customizing activity via the following path: **Financial Accounting** > **Bank Accounting** > **Business Transactions** > **Payment Transactions** > **Electronic Bank Statement**.

2. Assign the account symbol to the payment method.

   Make this setting in the **Assign Account Symbol to Payment Methods** Customizing activity. You can find the Customizing activity via the following path: **Financial Accounting** > **Accounts Receivable and Accounts Payable** > **Business Transactions** > **Outgoing Payments** > **Automatic Outgoing Payments** > **Payment Method/Bank Selection for Payment Program**.

Revise Payment Proposals

Use

With this app you can check and revise payment proposals and the details of open items. This allows you to make sure that all the payments are made correctly and on time and are compliant with company policies.

Key Features

- Display the open payment proposals for you to process.
- Check the exceptions log to analyze exceptional items in payment proposals.
- Edit the payment proposals to change the payment methods, partner bank account, and other payment-related information.
- Block and unblock items in payments and reallocate items among payments.
- Mass block items in payments.
- Sort the payment amount in ascending or descending order.
- Calculate the total payment amount by payee, currency, and other criteria.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

ℹ Note

If a payment proposal includes both incoming payments and outgoing payments, the key performance indicator on the tile displays only the amount of outgoing payments.

Supported Device Types

- Desktop

Relevant Business Catalog

`SAP_SFIN_BC_APAR_OPER`

Navigation Targets

The app enables users to access other apps directly (for example to display detailed information).

ℹ Note

These linked apps have to be already available in your system landscape or you have to implement them along with this app.

- Manage Automatic Payments

  #### ℹ Note

  When you navigate from the **Revise Payment Proposals** app to the **Manage Automatic Payments** app, it is possible that the **Manage Automatic Payments** app does not display all or any of the payment proposals that are displayed in the **Revise Payment Proposals** app. This is because the **Revise Payment Proposals** app displays all the open payment proposals while the **Manage Automatic Payments** app displays only the payment proposals that are within a specified date range. To change this date range, in the **Manage Automatic Payments** app click the drop-down list with you login user name as the label on the top-right corner of the app and select **Settings** from the context menu.

- Manage Journal Entries
- Display Supplier Balances

- Manage Supplier Line Items
- Manage Payment Blocks

App Extensibility: Revise Payment Proposals

Use

You can extend this app according to your business needs for different aspects. For this purpose, the following extensibility options are available:

- Customer Fields

  You can add customer fields to this app.

Customer Fields

To add a customer field to the app, the extensibility entities listed below are available on the different software layers. You have to extend each of these entities according to your specific business needs:

UI		Back End/ABAP		
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (in DDIC Structure)	Runtime: Sup
s1.view.xml	extProposalListColumns	PaytProposalInvoice	FAP_RPP_S_PAYTPRPSL_INVC_INCL	**Superclass:** CL_FAP_REV **Method:** PAYTPROPOS
		PaytProposalPayment	FAP_RPP_S_PAYTPRPSL_PAYT_INCL	**Superclass:** CL_FAP_REV **Method:** • PYATP • PYATP

Further Extensibility Entities

Extension Points

If there are additional fields available in the OData service, you can display these fields on the UI. For more information about extension points, see Extend SAP Fiori Apps.

UI Controller Hooks

If there are additional UI controller hooks available in the controller code, you can extend the UI controller code. For more information about UI controller hooks, see Extend SAP Fiori Apps.

More Information

For a general description of the extensibility options and procedures of SAP Fiori apps, see Extend SAP Fiori Apps.

Create Single Payment

Use

With this app you can make a direct payment to a supplier when no invoice exists and you can pay open supplier line items. When you make a direct payment to a supplier without an invoice, you specify the supplier details, the bank details, and the amount to be paid, then create the payment. The payment posts as a down payment request and then that document is used to initiate the payment run. When paying open supplier line items, you select the open items that you want to pay through the **Manage Supplier Line Items** app and create the payment to initiate the payment run. The payment information is automatically filled out. The open items clear when the payment run completes successfully. You receive a confirmation email with the details.

Key Features

- Execute extraordinary payments in one step and without an invoice
- Trigger the payment process for open items from the Fiori app Manage Supplier Line Items
- Make payments in foreign currencies
- Attach files, such as approval emails, to the payment
- Create a payment file upon completion of a successful payment run
- Receive a detailed log via email when you make a payment
- Print a payment summary

Note

Tax jurisdiction, which is used for determining tax rates in certain countries or regions such as the USA, is not supported.

Related Information

App Implementation: Create Single Payment
App Extensibility: Create Single Payment

App Implementation: Create Single Payment

Prerequisites

Before implementing the app, you must ensure the following:

- You have properly configured the e-mail functionality in your system to ensure you receive the log e-mails
- You have properly configured the attachment functionality in SAPOffice in your system
- You have properly configured the Adobe document service functionality in your system

Configuration Tasks

To be able to implement the app, you must perform the following configuration tasks in the back-end system:

- **Financial Accounting (New) > Accounts Receivable and Accounts Payable > Business Transactions > Down Payment Made**

  You have made settings in Customizing for using down payment requests.

- **Financial Accounting (New) > Accounts Receivable and Accounts Payable > Business Transactions > Outgoing Payments > Automatic Outgoing Payments**

  You have made settings in Customizing for using automatic outgoing payments.

- **Financial Accounting (New) > Accounts Receivable and Accounts Payable > Business Transactions > Outgoing Payments > Manual Outgoing Payments > Configure Manual Payments**

  You configure the behavior of the payments you create using the **Create Single Payment** app.

- **Financial Accounting (New) > Accounts Receivable and Accounts Payable > Business Transactions > Outgoing Payments > Manual Outgoing Payments > Configure Data Medium Exchange**

  You configure the data medium exchange for use with the **Create Single Payment** app.

If there are additional UI controller hooks available in the controller code, you can extend the UI controller code. For more information about UI controller hooks, see Extend SAP Fiori Apps.

More Information

For a general description of the extensibility options and procedures of SAP Fiori apps, see Extend SAP Fiori Apps.

Manage Payment Plans

Use

This app enables you to manage in one place all kinds of regular payment runs, such as payments to your suppliers and expense payments. You no longer have to manually and repetitively create payment runs. When you create a new payment plan, you define the plan category, payment method, and select the suppliers or customers to whom the payment plan applies. After that, you specify how often you would like the payment plan to run, as well as the posting date and document entry date. You can also choose to use factory calendar based on your needs. After the plan is created, you can activate, deactivate, edit and delete it. An active plan runs automatically as you scheduled.

Key Features

This app provides the following key features:

- Create payment plans for different company codes and payment methods.
- Categorize payment plans to, for example, distinguish between domestic and international payments.
- Specify how often a regular, fixed-date payment plan should run. Available options include daily, monthly, and weekly.

- Use customized calendar to schedule payment runs on non-fixed dates.
- Specify when a payment plan should run. Factory calendars are supported.
- Use selection criteria to specify which items should be included in a payment run.
- Activate and deactivate payment plans.
- Shift the next posting date for a fixed number of days based on the posting date of the last payment run.

> **Note**
>
> This feature is only supported for the recurrency type **D (Daily)**, **M (Monthly)** and **W (Weekly)**. The posting date for a payment plan based on customized calendar cannot be shifted.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

You configuration expert defines payment plan categories in the configuration activity **Define Payment Plan Categories**.

To schedule payment runs on non-fixed dates, your configuration expert define customized calendars in the configuration activity **Define Payment Plan Customized Calendar** based on your needs. For more information, see Configuring Customized Calendar for Payment Plans.

Payment Runs Scheduled from a Payment Plan

After a payment plan is activated in this app, you can find the job for the next payment run in the job list on the landing page of the Schedule Accounts Payable Jobs app. The job description starts with **Payment Plan:** and is followed by the plan name you have specified.

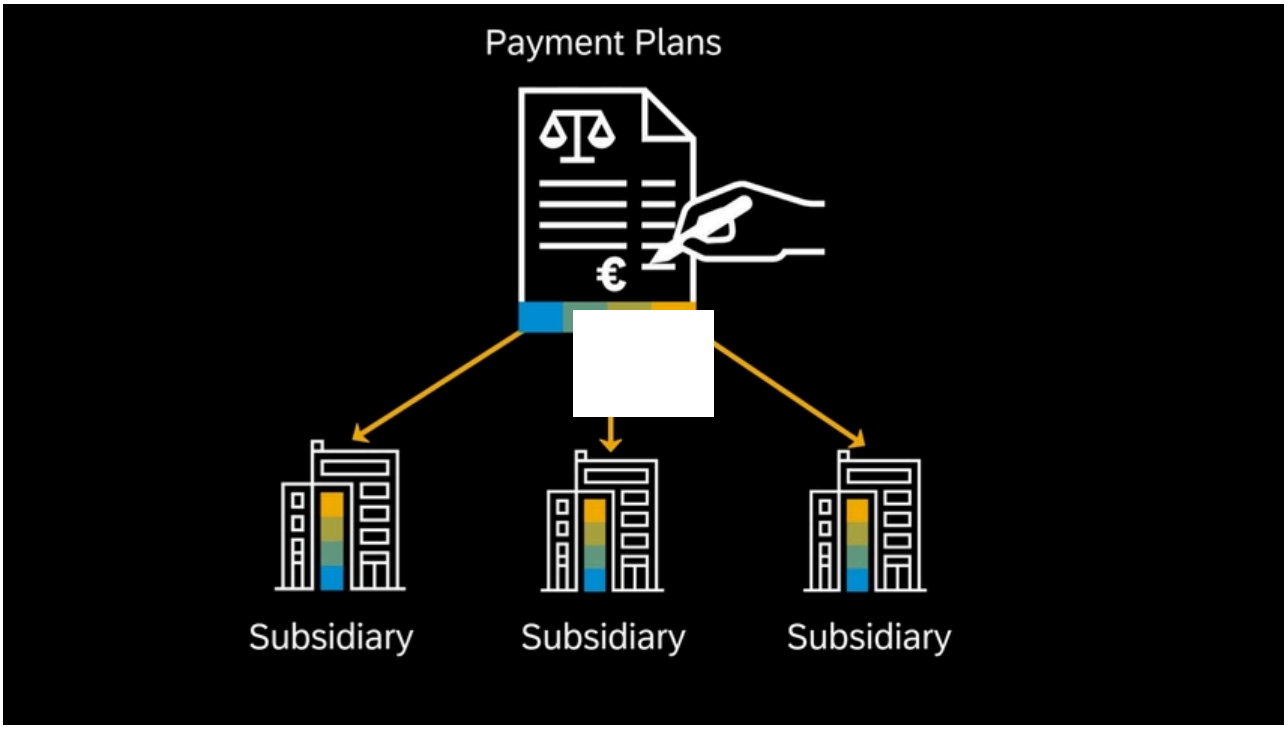

If you open the payment run, in the **Identification** subsection of the **Payment Run** section on the **Parameters** tab, you can find the following two display-only parameters whose values have been filled out automatically:

Field	Example Value	Explanation
Identification	A03GI	The value consists of five alphanumeric characters as explained below: • If a payment plan category is assigned to the payment plan, the first three characters are the category name. The last two are randomly-generated alphanumeric characters. • If a payment plan category is not assigned to the payment plan, all the five characters are randomly-generated alphanumeric characters.
Payment Plan UUID	506B4BC346481EEB8DC15B9B2F819ADF	This ID is used to identify payment runs from the same payment plan.

If you deactivate the payment plan, the job disappears from the job list. If you reactivate it, the job re-appears with a different identification but the same payment plan UUID. The UUID remains unchanged no matter what changes you have made to the

payment plan, such as updating the plan name or changing the recurrence pattern.

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

App-Specific Implementation Information in the SAP Fiori apps reference library:https://fioriappslibrary.hana.ondemand.com/sap/fix/externalViewer/index.html#/detail/Apps('F4806')/S25

Configuring Customized Calendar for Payment Plans

You use the configuration activity **Define Payment Plan Customized Calendar** to tailor payment run plan to your specific needs.

To meet your business needs for flexible payment run, customized calendar enables you to define payment run dates on a non-regular basis. You specify on which specific dates you would like your payment plan to run in this configuration activity. The customized payment run dates will be integrated into your payment plan in the **Manage Payment Plans** app.

Procedure

To use this configuration activity to define customized calendar, proceed as follows:

1. In your configuration environment, use the search function to open the following activity: **Define Payment Plan Customized Calendar**.
2. Choose **New Entries** to create new payment plan customized calendar and input description for your calendar.

   To specify which dates you would like to run payment plan, choose the customized calendar you defined and double click **Payment Plan Customized Calendar Segment**. Here you define a sequence of payment run dates.

ℹ Note

1. The payment run dates should be defined in time order.
2. The last payment run date has a next run date. For that reason, the end date for the payment plan you define in the **Manage Payment Plans** app must be later than the last run date you maintained in the customized calendar.
3. The maximum span for a customized calendar is one year (365 days). If the last payment run date is more than one year later than the first one, create a separate calendar.

For detailed information about the settings that are to be made in the configuration activity, choose the **Configuration Help** button.

After you finish this configuration, you can find your customized calendar in the **Manage Payment Plans** app if you choose customized calendar as recurrence type. You can reuse the customized calendar in more than one payment plan.

Manage Payment Plans

Manage Payment Media

Use

With this app you can transfer the data required for electronic payment transactions to banks via a data medium. A payment medium is created with each successful payment run. When you download a payment medium, the app automatically saves it as a .txt or .xml file according to its type.

Key Features

- View existing payment media with processing status
- Download payment media
- Delete payment media
- Display and analyze payment summary information that corresponds to data media

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

Maintaining Format Mappings for Structured Addresses

This topic describes how to maintain format mappings to include structured address fields for relevant parties (including creditor, ultimate creditor, creditor agent, debtor, ultimate debtor, debtor agent, and one-time vendor) in payment medium files.

Context

Structured addresses contain dedicated fields for address information such as town, street, house number, and even building and floor. Utilizing structured addresses for each party streamlines the payment medium format mapping process during payment medium file creation. To enable the generation of payment medium files with structured address information, you need to maintain format mappings with the fields associated with structured addresses in the Map Payment Format Data (ID: F2685) app, and assign the format mapping to the relevant payment medium format in the Create Payment Medium Formats Customizing activity. The payment medium format can then be used to generate payment medium files containing structured address information after payment runs.

Structures and Fields for Structured Address

The fields containing address information are available in relevant format trees. Click the › *(Navigation Right Arrow)* to expand the region and view the details. You can search for and add these fields to format mapping properties when maintaining format mappings in the Map Payment Format Data app.

Address Number Structure and Fields

Structure	Fields
FPAYH_SAD (Address Number for Structured Address)	ADRNR_CRD (Creditor Address Number)
	ADRNR_ULTICRD (Ultimate Creditor Address Number)
	ADRNR_CRDAGT (Creditor Agent Address Number)
	ADRNR_DBT (Debtor Address Number)
	ADRNR_ULTIDBT (Ultimate Debtor Address Number)
	ADRNR_DBTAGT (Debtor Agent Address Number)

One-Time Vendor Address Structure and Fields

Structure	Fields
FPAYH_OTV (One-time Vendor Information for Structured Address)	OTV_BUKRS (Company Code)
	OTV_BELNR (Document Number of an Accounting Document)
	OTV_GJAHR (Fiscal Year)
	OTV_BUZEI (Number of Line Item Within Accounting Document)
	OTV_ORT01 (City)
	OTV_LAND1 (Country/Region Key)
	OTV_STRAS (Street and House Number)
	OTV_PSTLZ (Postal Code)
	OTV_REGIO (Region (State, Province, Country))

Creditor Address Structure and Fields

Structure	Fields

	CTRYSUBDVSN_DBTAGT (Region (State, Province, Country))

Structure	Fields
	CTRY_DBTAGT (Country/Region Key)
	CTRYNM_DBTAGT (Country/Region Name)

Procedure

To maintain format mappings with relevant fields for structured addresses, complete the following steps:

1. Open the Map Payment Format Data app.
2. In the Mapping Type filter, select PAYM (Payment Medium Format).
3. Create a new format mapping of this type or copy from an existing one, and enter an ID and descriptive name for this format mapping.
4. Open the format mapping and choose Edit to start editing it.
5. Switch to the Accompanying Sheet tab, and specify whether to enable the accompanying sheet.
6. In the Format Mapping Properties structure, choose Create Node to add a postal address node to the relevant parties.
7. Assign party-specific fields as subnodes to the postal address node.

   In the Attributes section, maintain generic data for the subnodes.

   In the Source section, select Structure Field as the mapping procedure. In the value help for Structure Field, search for and add the structure fields from which the source values are transferred. You can find the structure fields for each party in the tables in the Structures and Fields for Structured Address section.
8. Repeat step 6 and 7 to add all the relevant structure nodes.
9. After making all your changes, select the Save button.
10. Select the Edit button again, and then select the Release button to change the status of the format mapping from Maintenance to Released.

Results

You have successfully created a format mapping with structured address fields for relevant parties in payment medium files. The next logical step is to assign the mapping to a payment medium format in the Create Payment Medium Formats Customizing activity. Navigation path in the SPRO transaction: Financial Accounting > Accounts Receivable and Accounts Payable > Business Transactions > Automatic Payments > Automatic Outgoing Payments > Payment Media > Make Settings for Payment Medium Formats from Payment Medium Workbench.

Post Outgoing Payments

Use

With this app you can post and clear a single outgoing payment in one step. You usually perform outgoing payments automatically based on payment proposals. However, if you want to perform a payment immediately, you need to enter the payment data manually. You can clear outgoing payments with open items. You can also post an outgoing payment on account or to a G/L account.

Key Features

- Obtain a list of open items that can be cleared with the outgoing payment
- Add or change the discount that is to be applied to each invoice
- Create residual items by entering a residual amount and assigning one or more reason codes and reference information about the business partner to residual items.

  In business configuration, you can define whether a new item is to be posted to the business partner account, or if the difference is to be cleared.
- Post an outgoing payment to a G/L account, if required with account assignment
- Post an outgoing payment on account
- Search for open items of selected suppliers or of all suppliers by means of fuzzy logic
- Create notes and attachments while posting the clearing document
- Enter characteristics for profitability-related postings to assign profitability segments
- Arrange open items using an invoice reference
- Simulate the resulting journal entry
- Clear the payment with the selected open items
- Export the **Open Items** list to a spreadsheet
- Make additional account assignments, for example, for bank fees

Supported Device Types

Desktop

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

App Extensibility: Post Outgoing Payments

Use

You can extend the **Post Outgoing Payments** app according to your business needs for different aspects. For this purpose, the following extensibility options are available:

Key users and developers can extend the app in the **Custom Fields and Logic** app using the following context:

- Coding Block

For Key Users and Developers

You can add fields to the following UI elements using UI adaptions at runtime:

UI Element	Business Context
Smart form	Coding Block (`FINS_CODING_BLOCK`)

For more information about how to adapt an SAP Fiori UI at runtime, see http://help.sap.com/nw75 ▸ Application Help ▸ UI Technologies in SAP NetWeaver with SAP_UI 750 ▸ SAP Fiori Launchpad ▸ Using the Launchpad ▸ Running an SAP Fiori App ▸ Adapting the UI of an SAP Fiori App at Runtime ▸ Making UI Adaptations.

You can implement logic for the following enhancement options:

For more information about the extensibility app, see http://help.sap.com/s4hana ▸ <Your SAP S/4HANA release> ▸ SAP NetWeaver for SAP S/4HANA ▸ General Functions for Key Users ▸ Extensibility.

More Information

For a general description of the extensibility options and procedures of SAP Fiori apps, see Extend SAP Fiori Apps.

Country/Region-Specific Fields

The following country/region-specific fields are available in the **Post Outgoing Payments** app when using a company code that is relevant in the given country/region:

Country/Region	Description of Fields
Bulgaria	You can enter the VAT document type.
Hungary	**Invoice Date**: Specifies the invoice date. **Invoice Number**: Specifies the invoice number. **Preceding Invoice Number**: Specifies the number of the preceding invoice.
Kazakhstan	**External Number** and **External Date**: Specify the external document number and date for documents.
Mexico	You can maintain the UUID number of your company in the **Mexico Compensation UUID for Electronic Accounting** field so that this information is included in the header of journal entries. You can also enter manual payment details.
Poland	You can maintain the **Transaction Date** field with the date a business operation occurred so that this information is included in the header of the document.
Russia	**External Document Date** and **External Number**: Specify the external document date and external document number. **Payment Order Date** and **Payment Order Number**: Specify the date and the number of the payment order (document that confirms the payment of the VAT) for the purchase or the sales ledger sections of the VAT return.
Singapore	**Long Header Text**: Specifies long explanations or notes with up to 50 characters which apply to the document as a whole, that is, not only for certain line items.
Slovenia	**Document Reference Number**: Specifies the document number in long format. Enter the document number if it exceeds the standard length.

Country/Region	Description of Fields
South Korea	Approval Number: Specifies the electronic tax invoice ID, which has been approved by the National Tax Service. Transfer Date of Tax Invoice: Specifies the date on which an electronic tax invoice is transferred to and validated by the National Tax Service.
Thailand	You can add the fields Branch Code and Branch Code Description as a filter in Adapt Filters for the app and export the corresponding columns to spreadsheets.

Monitor Payments

With this app you can display an overview of your payment batches. You can view the statuses of batches and individual payments at different processing stages.

Key Features

- Perform remediations to fix common problems with payment batches
- View the history of a payment batch, from creation to completion
- Edit the due date for payment batches and the instruction keys for individual payments
- Access the details for banks, accounts, and payments
- See contact information for all approvers of the batch
- Navigate to the details of the payment medium file if it has been created

ℹ Note

This app contains in-app help for key fields and concepts. To display the help while working in the app, press F1 or click the question mark displayed in the app header.

Unique End-to-End Transaction References

This app incorporates SWIFT's Unique End-to-End Transaction Reference (UETR). Unique references are assigned to cross-border payments. This reference can then be used to identify and track such payments in an external tracker hosted by SWIFT.

This app allows you to filter for the corresponding payment batch and identify the specific payment using this unique reference. You can also display the unique reference for all individual payments contained within a payment batch when you go to the batch details.

Supported Device Types

- Desktop

Information for Key Users

- This app incorporates SWIFT gpi reason codes to indicate the status of payments. External entities, such as banks, use reason codes to communicate the status of SWIFT gpi payments. Your entity receives these external Status Reason Codes and translates them into internal reason codes. One internal reason code may be mapped to many external reason codes.

You, as the key user for configuration, can create reason codes and map them to external reason codes in **Manage Reason Codes** in your configuration environment.

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. To see this app's Fiori content, go to the SAP Fiori apps reference library and search for the app. Then select the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Bank Account Aliases

Skill: Monitor Payments

Query information about payment batches and payment batch approvers.

Purpose

This skill allows you to query payment batch information using SAP CoPilot. You can simply say or type your query to see information such as all payment batches for a company code, payment batches by house bank, payment run, bank country, or any other listed filter within the app.

Required Data Input

There are no mandatory data inputs.

Examples of Commands

Limitations

Queries:

- Show me payment batches for company code XYZ
- Show me payment batches with rule XYZ
- Show me payment batches with payment run date last month
- Show me payment batches for house bank XYZ
- Show me payment batches
- Show me payment batches with payment run XYZ
- Show me payment batches for bank name XYZ
- Show me payment batches for account XYZ
- Show me payment batches for bank country XYZ
- Show me payment batch for payment document XYZ
- Show me approvers for batch number XYZ

Read:

- Show me payment batch XYZ

Available Languages

English

Remediations

You find remediations on the **Remediations** tab on the batch details screen of the **Monitor Payments** app. They are fixing functions you can use to correct common problems with payment batches. You can:

- Correct mismatched statuses
- Set payment batch status to **Automatically Rejected**
- Mass reset and reverse payment documents within payment batch items
- Add missing approvers to payment batches
- Retry payment medium creation

Prerequisites

You have taken the required actions to enable fixing functionalities, for example, manually resetting and reversing several payment documents to enable the 'Mass Reset and Reverse' functionality or rejecting or reversing all payment documents to enable setting the status 'Automatically Rejected' (IBC20).

Configuration

To configure remediations, you use the **Fix Errors for Payment Batches** activity in your configuration environment. For more information, see the configuration help documentation for this activity.

Payment Batch Status Check

Technical Name: `FIN_BCM_BATCH_STATUS_CHECK`

Target App: Monitor Payments.

Template used for Situation Handling that informs specific members in your team about payment batches that appear to be stuck in a defined status.

For background information about the Situation Handling framework, see the Product Assistance for Situation Handling.

Business Value

As a configuration expert for business processes (SAP business role `SAP_BR_BPC_EXPERT`), you can use this template for the following situation:

You want the members in your team to be informed automatically when a payment batch is stuck in a defined status.

Default Settings

The template comes with predefined settings. For the settings that aren't visible or self-explanatory, you can find information in the following sections. For generic information about how to configure situations based on this template, refer to the documentation of the Manage Situation Types app with which you can display and use the template.

For more information, see Manage Situation Types.

Situation Trigger Object and Anchor Object

These technical settings define for which object a situation is displayed (anchor object) and the object based on which a situation is triggered (trigger object):

Trigger Object: BatchUUID

Anchor Object: BatchUUID

Description: The situation is triggered when a payment batch is stuck in a defined status.

Conditions

The condition in this template defines that a situation is created with the status **Open** when a payment batch is stuck in a defined status and that a notification is sent when this happens. Various filter parameters, such as **Status** and **Days After Creation** are predefined in the situation template. **Status** allows you to specify a status to check on a stuck payment batch. **Days After Creation** tells you how long the batch has been stuck.

For more information, see Conditions.

Situation Display

When situations occur, users are informed about them by various texts, such as in-app situation messages or notifications on SAP Fiori launchpad. In this section, you can see all preconfigured texts.

For more information, see Situation Display.

ℹ Note

When you copy the template and adapt it to your needs, you can define the notification settings and change all text elements in this section. After making the changes in the original language, please remember to translate these changes into the other languages that you want to use. The template comes with translations that can be changed directly when you copy the template.

For more information, see Translate Situation Types.

Recipients

In this section, you see the predefined settings for determining who is responsible for a situation instance. Based on these, you can define who receives a notification when a situation instance is triggered (if enabled) or who sees the instance in the My Situations app.

The predefined settings in this template determine that the notification addresses only members of the Bank Communication Management (BCM) team category.

For more information, see Recipients.

Related Information

Payment Batch Was Rejected

Technical Name: `FIN_BCM_BATCH_REJECTED`

Target App: Monitor Payments.

Template used for Situation Handling that informs specific members in your team that a payment batch was rejected by your bank. Please note that this situation is only triggered when a bank rejects a payment batch.

For background information about the Situation Handling framework, see the Product Assistance for Situation Handling.

Business Value

As a configuration expert for business processes (SAP business role `SAP_BR_BPC_EXPERT`), you can use this template for the following situation:

You want the members in your team to be informed automatically when a payment batch has been rejected by your bank.

Default Settings

The template comes with predefined settings. For the settings that aren't visible or self-explanatory, you can find information in the following sections. For generic information about how to configure situations based on this template, refer to the documentation of the Manage Situation Types app with which you can display and use the template.

For more information, see Manage Situation Types.

Situation Trigger Object and Anchor Object

These technical settings define for which object a situation is displayed (anchor object) and the object based on which a situation is triggered (trigger object):

Trigger Object: BatchUUID

Anchor Object: BatchUUID

Description: The situation is triggered when a payment batch is rejected by your bank.

Situation Display

When situations occur, users are informed about them by various texts, such as in-app situation messages or notifications on SAP Fiori launchpad. In this section, you can see all preconfigured texts.

For more information, see Situation Display.

> **Note**
> When you copy the template and adapt it to your needs, you can define the notification settings and change all text elements in this section. After making the changes in the original language, please remember to translate these changes into the other languages that you want to use. The template comes with translations that can be changed directly when you copy the template.

For more information, see Translate Situation Types.

Recipients

In this section, you see the predefined settings for determining who is responsible for a situation instance. Based on these, you can define who receives a notification when a situation instance is triggered (if enabled) or who sees the instance in the My Situations app.

The predefined settings in this template determine that the notification addresses only members of the Bank Communication Management (BCM) team category.

For more information, see Recipients.

Key Concepts in Situation Handling

Payment Medium Creation Error

Situation Template ID: `FIN_BCM_FILE_CREATION_ERROR`

Consuming App: Monitor Payments

Business Value

As a configuration expert for business processes (SAP business role `SAP_BR_BPC_EXPERT`), you can use this template for the following situation:

You want the members in your team to be informed automatically when an error occurs during the creation of a payment medium.

Default Settings

The template comes with predefined settings. For the settings that aren't visible or self-explanatory, you can find information in the following sections. For generic information about how to configure situations based on this template, refer to the documentation of the Manage Situation Types app with which you can display and use the template.

Situation Trigger Object and Anchor Object

These technical settings define for which object a situation is displayed (anchor object) and the object based on which a situation is triggered (trigger object):

Trigger Object	BatchUUID
CDS View for Trigger Object	C_BANKBATCHSTATUSSITUATION
Anchor Object	BatchUUID
CDS View for Anchor Object	C_BANKBATCHSTATUSSITUATION
Trigger Type	Event

The situation is triggered when a payment medium wasn't created due to an error.

ℹ Note

These settings aren't visible in the template in the **Manage Situation Types** app and cannot be changed when you create a situation type based on this template. All of the following settings are visible in the template and you can adapt them when you copy the template to create a situation type.

Conditions

The condition in this template defines that a situation is created with the status **Open** when a payment medium wasn't created due to an error. Various filter parameters, such as **Bank Country/Region**, **Bank Key**, **Batch Number**, **House Bank**, and so on, are also predefined in the situation template. You can use the **Paying Company Code** filter, for example, if you want situations to be triggered only for a specific company code.

For more information, see Conditions.

Situation Display

When situations occur, users are informed about them by various texts, such as in-app situation messages or notifications on SAP Fiori launchpad. In this section, you can see all preconfigured texts.

ℹ Note

When you copy the template and adapt it to your needs, you can define the notification settings and change all text elements in this section. After making the changes in the original language, please remember to translate these changes into the other languages that you want to use. For more information, see Situation Display.

Recipients

In this section, you see the predefined settings for determining who is responsible for a situation instance. Based on these, you can define who receives a notification when a situation instance is triggered (if enabled) or who sees the instance in the My Situations app.

The predefined settings in this template determine that the notification addresses only members of the BCM (Bank Communication Management) team category. You can also use the predefined filters **Receiver ID**, **Sender ID**, **Company Code**, and **Paying Company Code** to narrow down the recipients.

For more information, see Recipients.

Situation Monitoring

Monitor Instances: Monitoring (the tracking of changes to situation instances) isn't enabled by default for situation templates. When you copy the template to create a situation type, you need to enable this option if you want to capture data for this situation type and enable the creation of business situation events. You can view the data in the Monitor Situations app.

> **Note**
> Customers are responsible for the data, including the adherence to legal restrictions in their judicial area. Neither SAP nor its associated companies assume any responsibility for the adherence to authorizations or data protection rules for data captured and processed by its customers. This means that customers alone must ensure adherence to these rules and regulations.

My Situations

Payment Batch Timeout

Situation Template ID: `FIN_BCM_TIMEOUT`

Consuming App: Monitor Payments

Business Value

As a configuration expert for business processes (SAP business role `SAP_BR_BPC_EXPERT`), you can use this template for the following situation:

You want the members in your team to be informed automatically when a timeout occurs during the lifespan of a payment batch.

> **Note**
> You can set up this notification for payment batches or payment files, such as payment mediums.

Default Settings

The template comes with predefined settings. For the settings that aren't visible or self-explanatory, you can find information in the following sections. For generic information about how to configure situations based on this template, refer to the documentation of the Manage Situation Types app with which you can display and use the template.

Situation Trigger Object and Anchor Object

These technical settings define for which object a situation is displayed (anchor object) and the object based on which a situation is triggered (trigger object):

Trigger Object	BatchUUID

CDS View for Trigger Object	C_BANKBATCHSTATUSTIMEOUT
Anchor Object	BatchUUID
CDS View for Anchor Object	C_BANKBATCHSTATUSTIMEOUT
Trigger Type	Event

The situation is triggered when a payment batch hasn't reached the next status within a defined period of time.

ℹ Note

You can define the period of time using the **Enable Timeout Notification with Situation Framework** activity. You find it under **Financial Supply Chain Management** > **Bank Communication Management** > **Payment Status Management**.

ℹ Note

These settings aren't visible in the template in the **Manage Situation Types** app and cannot be changed when you create a situation type based on this template. All of the following settings are visible in the template and you can adapt them when you copy the template to create a situation type.

Conditions

The condition in this template defines that a situation is created with the status **Open** when a payment batch status hasn't changed during a defined period of time. Various filter parameters, such as **Batch Number**, **Timeout in Hours**, **Timout in Minutes**, and so on, are also predefined in the situation template. You can use the **Batch Number** filter, for example, if you want situations to be triggered only for specific payment batches.

For more information, see Conditions.

Situation Display

When situations occur, users are informed about them by various texts, such as in-app situation messages or notifications on SAP Fiori launchpad. In this section, you can see all preconfigured texts.

ℹ Note

When you copy the template and adapt it to your needs, you can define the notification settings and change all text elements in this section. After making the changes in the original language, please remember to translate these changes into the other languages that you want to use. The template comes with translations that can be changed directly when you copy the template.

For more information, see Situation Display.

Recipients

In this section, you see the predefined settings for determining who is responsible for a situation instance. Based on these, you can define who receives a notification when a situation instance is triggered (if enabled) or who sees the instance in the My Situations app.

The predefined settings in this template determine that the notification addresses only members of the BCM (Bank Communication Management) team category. You can also use the predefined filters **Receiver ID**, **Sender ID**, **Company Code**, and **Paying Company Code** to narrow down the recipients.

For more information, see Recipients.

Monitor Instances: Monitoring (the tracking of changes to situation instances) isn't enabled by default for situation templates. When you copy the template to create a situation type, you need to enable this option if you want to capture data for this situation type and enable the creation of business situation events. You can view the data in the Monitor Situations app.

> **Note**
> Customers are responsible for the data, including the adherence to legal restrictions in their judicial area. Neither SAP nor its associated companies assume any responsibility for the adherence to authorizations or data protection rules for data captured and processed by its customers. This means that customers alone must ensure adherence to these rules and regulations.

Free Form Payments

Business Process

You use the **Free Form Payments** apps to process free form payment requests. Depending on your role, you can create, check, edit, post, reverse, and release payment requests.

- You can use **My Free Form Payments** to create payment requests and view, edit, or reverse payment requests that you have created.
- You can use the SAP CoPilot app **Create Free Form Payments** from any Fiori app to create free form payments without leaving your current screen.
- You can use **Process Free Form Payments** to process all payment requests regardless of the creator of the request. The app allows you to create, edit, post, release, and reverse requests.

After they are released, the payment requests created in the **Free Form Payments** apps can then be processed further through the apps **Monitor Payments** and **Approve Bank Payments**.

Example

Example Business Process

1. While working in an app, an accounts payable account determines the need to create a payment request. The accountant accesses SAP CoPilot on the same screen through © and creates a free form payment request.
2. Later, the accountant decides to change the details of the request. They go to the **My Free Form Payments** app and find the request they have created, make the changes, then notify the cash specialist of the request.
3. The cash specialist goes to the **Process Free Form Payments** app and reviews the request, posts it, and releases it. The request is incorporporated into a payment batch and enters the approval process.
4. An accounting manager uses the **Monitor Payments** app to review the batch containing the payment request to determine the status of the batch in the approval process.
5. An accounting manager uses the **Approve Bank Payments** app to approve the payment batch containing the payment request.

Request Statuses in Free Form Payments

Payment requests in the Free Form Payment apps can have the following statuses:

- **Created**

  A new payment request. You can still edit or reverse a request in this status.

- **Posted**

  A journal entry has been created for this request. You can't edit a payment request that has been posted, but you can reverse it.

- **Released**

  A journal entry has been created for this request and the payment run is pending. You can't edit a payment request that has been released, but you can reverse it.

- **Cleared**

  A clearing entry has been created for this request, the payment run was successful, and the payment has been posted to the clearing account. You can't edit or reverse a payment request that has cleared.

- **Reversed**

  The payment process has been stopped. You can't edit or process this payment request further. You must create a new payment request if you want to proceed with the payment.

Prerequisites

You must make the following settings:

- You can make settings in Customizing to define the order in which the steps of the online entry for payment requests are to take place: Starting with entering a payment request, through processing by the payment program, to the creation of the payment media via the Payment Medium Workbench. You make these settings under **Financial Accounting (New)** > **Bank Accounting** > **Business Transactions** > **Payment Transactions** > **Online Payments** > **Define Process Steps**.

  If you do not make any settings, the process ends with the creation of the payment requests released for payment.

- Activate scenario `FI_BL_PAYRQ_RELEASE` in the **Information System for Scenario-Based Checks** (transaction `SACF_INFO`).

  If you do not activate this scenario, you will receive errors.

Monitor Payments

My Free Form Payments

With this app you can display a list of payment requests you have created. You can create, edit, or reverse your payment requests.

Key Features

- View the details of payment requests, including posting and payment data
- Release and reverse payment requests
- Display and use payee aliases
- Supports Swiss QR-Bills through the **Additional Info** field

ℹ Note

This app contains in-app help for key fields and concepts. To display the help while working in the app, press F1 or click the question mark displayed in the app header.

Swiss QR-Bills

This app allows you to enter details related to Swiss QR-Bills in the **Additional Info** field. It's an optional, free text entry field and is available when the following prerequisites are met:

- The **Payment Request Type** is **For Supplier** or **Free Form Payment**.
- The company code is configured for QR-Bills.
- The currency is CHF or EUR.
- A payment method for QR-Bills exists.
- The house bank country is Switzerland.
- The IBAN is Swiss or Liechtensteiner and is a QR-IBAN (having a special range 31000-31999 in positions 5-9).
- The QR Reference in the format ***ESRRE n(27)** is specified in the **Reference Text** field.

Supported Device Types

- Desktop
- Tablet
- Smartphone

Information for Key Users

The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. To see this app's Fiori content, go to the SAP Fiori apps reference library and search for the app. Then select the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Create Free Form Payment

CoPilot App to Create Free Form Payment

The digital assistant SAP CoPilot allows you to create a free form payment from the context of your current Fiori screen using the app Create Free Form Payment. For example, while working in an app, you need to create a new free form payment. You can easily access SAP CoPilot and create a new free form payment without leaving your current screen.

Creating a Free Form Payment

1. Open SAP CoPilot and click **New**.
2. Select the plus sign and choose**Create New Object**.
3. Select the **Payment Request Type** and specify the payment details.
4. Click **Create**.

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Process Free Form Payments

With this app you can display a list of payment requests and view the details of individual requests. Depending on your role, you can also release or reverse payment requests. When you release a request, the payment run is initiated and the payment batch is created.

Key Features

- View the details of payment requests, including posting and payment data
- Release and reverse payment requests
- Display and use payee aliases
- Supports Swiss QR-Bills through the **Additional Info** field

ℹ Note

This app contains in-app help for key fields and concepts. To display the help while working in the app, press F1 or click the question mark displayed in the app header.

Swiss QR-Bills

This app allows you to enter details related to Swiss QR-Bills in the **Additional Info** field. It's an optional, free text entry field and is available when the following prerequisites are met:

App Extensibility: Free Form Payments

As a key user, you can extend the **Process Free Form Payments** and **My Free Form Payments** apps according to your business needs.

Custom Fields

You can create and edit custom fields to enhance applications using the **Custom Fields** app. You can add fields to the following UI elements using key user adaptation:

Business Context	UI Technology	Navigation Path	UI Element Type
Payment Request	Fiori	List of Payment Requests > Payment Request Details	Object Page

For more information, see:

- Creating Custom Fields

Custom Logic

With the **Custom Logic** app, you can create and maintain implementations of custom logic that can be used to enhance applications and change application behavior. You can implement custom logic for the following business add-ins (BAdIs):

BAdI Name	Business Context	Business Use
`FINS_PAYT_REQUEST_ACCTG_DOC`	Payment Request	Used to fill in additional fields in the corresponding accounting document.

BAdI Name	Business Context	Business Use
FINS_PAYT_REQUEST_ON_POST	Payment Request	Allows you to implement checks on your custom fields and standard payment request fields before the payment request is posted.
FINS_PAYT_REQUEST_VALIDATION	Payment Request	Allows you to implement validation checks for your custom fields in a payment request.
FINS_PAYT_REQ_DETERMINATION	Payment Request	Allows you to determine how a custom field should interact with other fields in a payment request. You can assign specific values to other fields when the user selects or modifies your custom field.

For more information, see:

- Creating Implementations
- For more information about the individual BAdIs, check the BAdI-specific documentation: **Custom Logic > <your implementation > > BAdI Documentation > View BAdI Documentation**

Display Status of Payment Documents

App ID: F7084

With this app, you can display an overview of your payment documents and their statuses. You can view the statuses of individual payments and their payment batches.

Key Features

You can use this app to do the following:

- View the status of a payment document
- Access the detail of payment documents with bank information, amounts, accounts and business partners
- Navigate to the details of the payment batch, payment run or payment document

Supported Device Types

- Desktop
- Tablet

Checks

The following apps are related to checks:

- Manage Checkbooks
- Manage Outgoing Checks
- Create Positive Pay Files

Manage Checkbooks

Use

With this app you can monitor and manage checkbook usage in your organization. The app provides an overview of the status of different checkbooks, including an alert status for checkbooks nearing depletion, and allows you to act on this information immediately.

This app is available for the roles **Accounts Payable Accountant** and **Accounts Payable Manager**.

Key Features

- Create new checkbooks
- Monitor the usage and depletion status of existing checkbooks
- Delete unused checkbooks
- Edit existing checkbooks
- Define successor checkbooks to come into use when the current checkbook has been exhausted
- Reorder checkbooks
- Split checkbooks

In addition, the app supports the following technical features and options:

- E-mail integration
- Export to spreadsheet option

Related Apps

Manage Checkbooks - China

With this tile, you can manage the types of the checkbooks in your organization if you have the business role Accounts Payable Accountant for China.

Checks must be one of three possible types, as follows:

- Cash Check

  The payee can use the check to deposit funds to a cash account or to withdraw cash directly.

- Transfer Check

  The payee can use the check to deposit funds to the designated account only. It is not possible for the bearer or the person named on the check to redeem the check in cash. A transfer check may also be known as a crossed check, in reference to the parallel markings (//) in the top left that signify the funds must be paid into the designated account.

- Open Check

  The check type is undefined, that is, it may be defined as either a cash check or a transfer check.

ⓘ Note

The **Check Type** field is only relevant for the China edition of the Manage Checkbooks app.

App Extensibility: Manage Checkbooks

Use

You can extend the Manage Checkbooks app according to your business needs for different aspects. For this purpose, the following extensibility option is available for developers:

- You can extend the table by adding columns at the beginning or end of the table.

Further Extensibility Entities

Extension Points

If there are additional fields available in the OData service, you can display these fields on the UI. For more information about extension points, see Extend SAP Fiori Apps.

If there are additional fields available in the OData service, you can display these fields on the UI. For more information about extension points, see Extend SAP Fiori Apps.

More Information

For a general description of the extensibility options and procedures, see Extend SAP Fiori Apps.

Manage Outgoing Checks

Use

With this app you can monitor and manage outgoing checks in your organization. The app provides an overview of the status of different outgoing checks, indicating whether an outgoing check is new, voided or cashed, and allows you to act on this information immediately.

This app is available for the roles **Accounts Payable Accountant** and **Accounts Payable Manager**.

Key Features

- Create outgoing checks
- Edit outgoing checks
- Void outgoing checks
- Cash outgoing checks
- Reprint outgoing checks

China-specific extension is provided for this app. For further information, see Manage Outgoing Checks for China.

In addition, the app supports the following technical features and options:

- E-mail integration
- Export to spreadsheet option

Component for Customer Incidents

`FI-FIO-AP`

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Manage Outgoing Checks - China

With this tile, you can manage the types of the outgoing checks in your organization if you have the business role Accounts Payable Accountant for China.

Checks must be one of three possible types, as follows:

- Cash Check

  The payee can use the check to deposit funds to a cash account or to withdraw cash directly.

- Transfer Check

  The payee can use the check to deposit funds to the designated account only. It is not possible for the bearer or the person named on the check to redeem the check in cash. A transfer check may also be known as a crossed check, in reference to the parallel markings (//) in the top left that signify the funds must be paid into the designated account.

- Open Check

  The check type is undefined, that is, it may be defined as either a cash check or a transfer check.

The type of a check derives from the checkbook that the check comes from. However, you can edit the check type if the check is from an open checkbook. Before voiding or cashing a check, you must define it as either a cash check or a transfer check.

Note

The **Check Type** field is only relevant for the China edition of the Manage Outgoing Checks app.

Create Positive Pay Files

This app enables you to create a file of check information that belongs to a paying company code.

Key Features

This app provides the following key features:

- Define whether to create a file for checks from Payroll Accounting or Financial Accounting.
- Define which checks to include in the file:
  - Checks that are not yet extracted

    Include only the checks that have not yet been extracted. Both checks that are new in the system and those that were previously extracted but have since changed, for example voided, are included.

  - Checks from a payment run

    For more information, see the **Extracting Checks from a Payment Run** section below.

  - Checks from a previous extract
  - Checks that match certain selection criteria
- Define the output format of the file. Here, you can specify whether to keep the payment amount information in voided checks when generating the check file.
- Send the file via an API.

Extracting Checks from a Payment Run

Business Process

After you create a payment run, you can extract the checks in it and export the result using SAP Multi-Bank Connectivity. The business process is as follows:

1. Open the Manage Automatic Payments app.
2. Create a payment run.
3. Open the **Create Positive Pay Files** app.
4. Select **Checks from the payment run** in the **General selections** section and enter the run date and the ID for the payment run.
5. Enter a payment medium format with SAP Multi-Bank Connectivity configured as output channel. For more information, see the **Configuration Information** subsection.
6. Choose **Execute**.

Configuration Information

To configure the payment medium format that you enter in step 5 in the **Business Process** subsection above, you can use either of the following two configuration activities:

Configuration in Create Payment Medium Formats

1. Open the Customizing activity **Create Payment Medium Formats** under **Financial Accounting (New)** > **Accounts Receivable and Accounts Payable** > **Business Transactions** > **Outgoing Payments** > **Automatic Outgoing Payments** > **Payment Media** > **Make Settings for Payment Medium Formats from Payment Medium Workbench**.
2. Double-click the payment medium format that you enter.
3. Select **Connector for SAP Multi-Bank Connectivity** from the **Type** drop-down list for the **Electronic Payment Medium** checkbox in the **Format output** section.
4. Save your changes.

Configuration in Set Up Payment Medium Formats per Company Code

1. Open the customizing activity **Set Up Payment Medium Formats per Company Code** under **Financial Accounting (New)** > **Accounts Receivable and Accounts Payable** > **Business Transactions** > **Outgoing Payments** > **Automatic Outgoing Payments** > **Payment Method/Bank Selection for Payment Program**.
2. Create a payment medium format per company code, and select **SAP Multi-Bank Connectivity** from the **Alternative Format Type** dropdown list.
3. Save your changes.

ℹ Note

For the payment medium format **Positive Pay Format for DMEE for United States** (`US_POSIPAY`), the following options are not supported in the configuration activity **Create Payment Medium Formats**:

- **Struct. for Format Parameters** under **Program Control**

  No default format-specific parameters are available for this format.

- **Payment medium output divided by level of detail**

  The output files for the format **Positive Pay Format for DMEE for United States** are grouped based on paying company code and house bank, provided that this fulfills other specified selection criteria. The levels of details here are not supported for this format.

- **Text Fields for Reference Information**

There is no default settings for **Text Fields for Reference Information**. For the **Type** (**Type of Notification**) field, the note to payee relevant options are not supported for this format.

Supported Device Types

Desktop

Reporting and Analysis

The following apps are related to reporting and analysis:

- Accounts Payable Overview
- Aging Analysis
- Approve Bank Payments
- Cash Discount Forecast
- Cash Discount Utilization
- Days Payable Outstanding
- Days Payable Outstanding - Detailed Analysis
- Days Payable Outstanding – Indirect Method
- Days Payable Outstanding – Indirect Method - Detailed Analysis
- Future Payables
- Invoice Processing Analysis
- Overdue Payables
- Supplier Payment Analysis (Open Payments)
- Supplier Payment Analysis (Manual and Automatic Payments)
- Display Item Change Log

Accounts Payable Overview

With this analytical overview app, you can monitor important accounts payable indicators and access the relevant accounts payable apps. You can use the filters to limit the data behind the indicators to the information most relevant for you.

Key Features

This overview app includes the following indicators:

- **Parked Invoices**

  The KPI area at the top of the card displays the average days parked of your parked invoices. You can click on the KPI area to navigate to the **Manage Supplier Line Items** app. Use the drop down list to sort the displayed invoices:

  - By Entry Date

- By Amount
- By Amount in Document Currency

- **Blocked Invoices** (Chart)

  The KPI area at the top of the card displays the total amount in display currency of all your blocked invoices as of today. You can click on the KPI area to navigate to the **Manage Supplier Line Items** app. Use the drop down list to sort the blocked invoices shown in the chart:

  - By Age
  - By Block Reason

- **Blocked Invoices**

  The KPI area at the top of the card displays the total amount in display currency of all your blocked invoices as of today. You can click on the KPI area to navigate to the **Manage Supplier Line Items** app. Use the drop down list to sort the displayed invoices:

  - By Age
  - By Amount
  - By Amount in Document Currency

- **Cash Discount Utilization**

  The KPI area at the top of the card displays the total amount in display currency of cash discounts taken during the period. It also shows how this amount deviates from the cash discount target. You can click on the KPI area to navigate to the **Cash Discount Utilization** app.

  The chart shows the lost cash discounts and the taken cash discounts for the current month and the previous month. Use the drop down list display the amounts in the chart either stacked or side by side.

- **Days Payable Outstanding Indirect**

  The KPI area at the top of the card displays your average days payable outstanding over the last 12 months. You can click on the KPI area to navigate to the **Days Payable Outstanding - Indirect Method** app. The chart displays days your DPO by month over the last 12 months.

  For information regarding the calculation logic, see the app description for **Days Payable Outstanding - Indirect Method**:

  Days Payable Outstanding – Indirect Method

- **Days Payable Outstanding Direct**

  The KPI area at the top of the card displays your average days payable outstanding over the last 12 months. You can click on the KPI area to navigate to the **Days Payable Outstanding** app. The chart displays your DPO by month over the last 12 months calculated at the document level.

  For information regarding the calculation logic, see the app description for **Days Payable Outstanding**:

  Days Payable Outstanding

- **Payable Aging**

  The KPI area at the top of the card displays your total overdue amount as of today in the display currency. You can click on the KPI area to navigate to the **Aging Analysis** app. The chart displays open invoices separated into age intervals. Use the drop down list to display either overdue invoices or invoices that are not due yet.

- **Suppliers with Debit Balances**

The KPI area at the top of the card displays your debit balance as of today in the display currency. You can click on the KPI area to navigate to the Manage Supplier Line Items app. The chart displays a list of supplier accounts with debit balances, sorted by amount.

- Invoices Blocked in Supplier Master Data

  The KPI area at the top of the card shows the sum in the display currency of all invoices blocked in the supplier master data. You can click on the KPI area to navigate to the Manage Supplier Line Items app. The chart also displays the sum of all open invoices where a payment block is set in the supplier master data. Use the drop down list to group the invoices either by age or by block reason.

- Posted Invoices in Current Period

  The KPI area at the top of the card displays the sum of all invoices posted in the current period in the display currency. The chart displays the cumulative statistics for invoices posted in the current period by entry date. Use the drop down list to display cumulative statistics:

  - By Amount
  - By Count
  - By Count by User

- My Inbox

  Displays your tasks and activities sorted by priority.

- Due Invoices Free for Payment

  The KPI area at the top of the card displays the total amount in the display currency of due invoices that are free for payment as of today. You can click on the KPI area to navigate to the Manage Supplier Line Items app. The chart displays due invoices which are free for payment grouped by days in arrears.

- Invoice Processing Statistics

  The KPI area at the top of the card displays the average time in days it took you to process invoices for the processing step and period selected in the dropdown list. The chart displays statistics related to invoice processing. For example, the number of days from issue date to posting date and the days difference between due date and payment date. Use the drop down list to display the following statistics:

  - Average number of days from invoice date to payment date per fiscal period
  - Number of invoices processed from invoice date to posting date in the current fiscal period
  - Average number of days from due date to payment date by fiscal period
  - Number of invoices processed from due date to payment date in the current fiscal period
  - Average number of days from parked to posted by fiscal period
  - Number of invoices processed from parked to posted in the current fiscal period

- Posted Invoices

  The KPI area at the top of the card displays either the amount or count of posted invoices in the last 6 fiscal periods, depending on your selection in the drop down list. The chart displays the breakdown of amount or count per fiscal period over the last 6 fiscal periods, depending on your selection in the drop down list .

ℹ Note

This app contains in-app help for key fields and concepts. To display the help while working in the app, press F1 or click the question mark displayed in the app header.

- Cash Discount Utilization

Aging Analysis

Use

With this app you can see the aging information across your organization so that you can identify negative trends in the total payable amount, the net due amount, and the overdue amount. This allows you to timely react by having your team taking appropriate actions to reverse these trends.

Calculation Logic

The numbers on the app tile and in the top-left corner of the app indicate the total amount of open payables.

The total payable amount is the sum of overdue payables and future payable.

Key Features

- Display the payable amount, including the overdue amount and the not due amount, by aging, company code, G/L account, currency, supplier group and supplier.
- Filter the payable amount by company code, document status, supplier, supplier account group, and so on.
- Specify the key date for data analysis.

  This analytical app uses a single date as its key date. You can choose from the existing list of key dates in this app or create additional key dates using the Manage Date Functions app. You can create a single date or a date range as a key date.

To define key dates, you must be assigned a role that has the same minimum authorization and business catalogs as the **Analytics Specialist** (`SAP_BR_ANALYTICS_SPECIALIST`) business template role.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

This app uses the `C_APFLEXIBLEAGING` CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

Supported Device Types

- Desktop
- Tablet

Navigation Targets

The app enables users to access other apps directly (for example to display detailed information).

Cash Discount Forecast

Use

With this app you can forecast the available cash discounts in the short term. You can get a prediction over the discounted amount of blocked invoices on the next payment days.

Calculation Logic

The numbers on the app tile and in the top-left corner of the app indicate the total amount of the available cash discounts for the invoices that are still open.

Key Features

- Display the cash discounts that are expiring in a future period that you have defined. The cash discounts are available on the key date but will expire by the end of the period.
- Analyze the expiring cash discounts by company or payment terms. For each company or payment term, the app displays the expiring cash discounts, the available cash discounts on the key date, and the expired cash discounts before the key date. The available cash discounts on the key date refer to the cash discounts that are available from the key date to the future.
- Analyze the expiring cash discounts by payment day. For each payment day, the app displays the cash discounts that are expiring between this payment day and the next. It also displays the cash discounts for invoices with payment block within this period.

> **Note**
> In order not to lose the cash discounts that are expiring between this period, pay for the invoices with these cash discounts on the current payment day. This is because if you pay for the invoices on the next payment day, the discounts will have already expired.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

This app uses the `C_APCASHDISCOUNTFORECAST` CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

Supported Device Types

- Desktop
- Tablet

Navigation Targets

The app enables users to access other apps directly (for example to display detailed information).

> **Note**

KPI

KPI ID: `.SAP.AP.DISCFORECASTKPI`

KPI Description: `Cash Discount Forecast`

Goal Type: `Maximizing`

Evaluation

Evaluation ID: `.SAP.AP.DISCFORECASTKPI.1MONTH`

Evaluation Description: `Expiring in 1 Month`

Targets, Thresholds, and Trend

Parameter	Value
Goal Type	`Maximizing`
Value Type	`Fixed Value`

Input Parameters and Filters

The following tables show the input parameters, filters, and some preconfigured example values. Use your own values where required, according to the data in your backend system.

Input Parameters

Input Parameter	Operator	Example Value	Explanation
`Display Currency`	`Equal to`	`EUR`	Choose a currency in which the currency amounts should be displayed. Ensure that exchange rates for this currency exist in your system. An entry in this field is required.
`Forecast Days`	`Equal to`	`30`	Enter the number of days after today. The app displays the cash discounts that will expire in this period.
`Payment Cycle`	`Equal to`	`1`	Specify whether you make weekly or monthly payments. An entry in this field is required. If you make weekly payments, enter `1`. If you make monthly payments, enter `2`.
`Payment Day1`	`Equal to`	`2`	Enter the first payment day in the week or the month. An entry in this field is required. **Example** If you specify to make weekly payments in the `Payment Cycle` input parameter and if you make payments on Mondays and Fridays, enter `1` for the `Payment Day1` input parameter and `5` for the `Payment Day2` input parameter. If you specify to make monthly payments in the `Payment Cycle` input parameter and if you make payments on the 10th and the 20th day of each month, enter `10` for the `Payment Day1` input parameter and `20` for the `Payment Day2` input parameter.
`Payment Day2`	`Equal to`	`5`	Enter the second payment day in the week or the month. An entry in this field is optional. If you do not have a second payment day, enter `0`.

Input Parameter	Operator	Example Value	Explanation
Payment Day3	Equal to	15	Enter the third payment day in the week or the month. An entry in this field is optional. If you do not have a third payment day, enter 0. Also, if you specify to make weekly payments in the Payment Cycle input parameter, only two payment days are supported; the app ignores the third payment day you enter.

Cash Discount Utilization

Use

With this app you can monitor in real time the cash discount utilization in your responsible area. You can find out which company code or location needs to make better use of cash discounts.

Calculation Logic

For information about how the numbers on the app tile and the number in the top-left corner of the app are calculated, see Calculation Logic: Cash Discount Utilization.

Key Features

- Display the utilization rate of cash discounts in a past period that you have defined.

  The utilization rate is calculated by dividing the taken cash discounts with the sum of taken cash discounts and lost cash discounts. The tile displays the weighted average of the utilization rate for all your business entities.

- Compare the current utilization rate versus the target utilization rate.
- Check whether, according to the app configuration, the current utilization rate is critically low, deserves attention, or is acceptable.
- Analyze cash discount utilization by different business dimensions, including company, country, supplier group, and payment terms.

  Note

  Just because the utilization rate of cash discounts for a company is high does not mean that only a small amount of cash discounts are lost. Always take into consideration the total offered cash discounts for a company.

- Display the utilization rate of cash discounts when you analyze cash discount utilization by company, country, supplier group, or payment terms.

  Note

You can configure this app to display the utilization amount instead of the utilization rate of cash discounts.

- Distinguish between taken cash discounts and lost cash discounts. Taken cash discounts refer to the cash discounts that you have utilized while lost cash discounts refer to those that you have not.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

This app uses the `C_APCSHDISCUTILIZATION` CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

- Configuration Settings: Cash Discount Utilization

Calculation Logic: Cash Discount Utilization

The equation below illustrates how the numbers on the app tile and in the top-left corner of the app are calculated and is followed by an explanation :

$$U = \frac{\sum_{i=1}^{n} T_i}{\sum_{i=1}^{n} O_i} * 100\%$$

Where

U = Cash discount utilization ratio from a start date specified in the P_StartDate input parameter till today
T_i = Cash discounts taken from an invoice in this period
O_i = Cash discounts offered for an invoice in this period

How Cash Discount Utilization Ratio Is Calculated

The app calculates the cash discount utilization ratio from a start date specified in the `P_StartDate` input parameter till today in the following way:

1. The app calculates of the sum of the cash discounts taken from the invoices in this period.
2. The app calculates of the sum of the cash discounts offered for the invoices in this period.
3. The app divides the sum of the taken cash discounts by the sum of the offered cash discounts.
4. The app multiplies the quotient by 100%.

The result is the cash discount utilization ratio.

For information about the `P_StartDate` input parameter, see Configuration Settings: Cash Discount Utilization.

Days Payable Outstanding

Use

With this app you can drill down to check the top 10 suppliers with the highest or the lowest days payable outstanding. You can view the result in a chart or a table according to company code, supplier, country of the supplier, and timeline.

Calculation Logic

For information about how the numbers on the app tile and the number in the top-left corner of the app are calculated, see Calculation Logic: Days Payable Outstanding.

Key Features

- View days payable outstanding by last 12 months

  You can analyze days payable outstanding for the last 12 months. For each month, you can drill down to the ten suppliers who have the highest/lowest days payable outstanding.

- View top 10 days payable outstanding by suppliers

  You can analyze the top ten suppliers who have the highest value of the KPI days payable outstanding. You can also analyze the top ten suppliers who have the lowest value of the KPI days payable outstanding.

- View days payable outstanding by company codes

You can analyze days payable outstanding according to company codes. For each company code, you can drill down further to the top ten suppliers with the highest/lowest value of days payable outstanding.

- Filter days payable outstanding by suppliers

  You can filter the days payable outstanding by supplier name. For example, you can select certain suppliers and check for the days payable outstanding.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

This app uses the `C_APDAYSPAYOUTST` CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

Supported Device Types

- Desktop
- Tablet

Navigation Targets

From this app, you can access the following apps directly:

Note

These linked apps have to be already available in your system landscape or you have to implement them along with this app.

- Days Payable Outstanding - Detailed Analysis
- Display Supplier Balances
- Manage Supplier Line Items

Component for Customer Incidents

`FI-FIO-AP`

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

- Configuration Settings: Days Payable Outstanding

Calculation Logic: Days Payable Outstanding

On the App Tile

On the app tile, the app displays three numbers that represent the days payable outstanding in the 12th, the 11th, and the 10th month before the current month, respectively.

The equation below illustrates how these numbers are calculated and is followed by an explanation:

$$O_m = \frac{\sum_{i=1}^{n}(P_{m,i} * N_{m,i})}{\sum_{i=1}^{n} P_{m,i}}, m \in [M-12, M-10]$$

Where

O_m = Days payable outstanding for month m
$P_{m,i}$ = Amount of an invoice paid in month m
$N_{m,i}$ = Number of days between the posting and the clearing date of the invoice
M = Current month

How Days Payable Outstanding on the App Tile Is Calculated

The app calculates the days payable outstanding for each month in the following way:

1. The app finds all the paid invoices in a month.
2. For each such invoice, the app multiplies the invoice amount by the number of days between the posting and the clearing date of the invoice.
3. The app adds up the product from each multiplication.
4. The app divides the sum by the total amount of all these invoices.

The quotient is the days payable outstanding for that month.

In the Top-Left Corner of the App

In the top-left corner of the app, the app displays the days payable outstanding from 365 days ago till today.

The equation below illustrates how this number is calculated and is followed by an explanation:

$$O = \frac{\sum_{d=D-365}^{D}\sum_{i=1}^{n}(P_{d,i} * N_{d,i})}{\sum_{d=D-365}^{D}\sum_{i=1}^{n} P_{d,i}}$$

Where

O = Days payable outstanding from 365 days ago till today
$P_{d,i}$ = Amount of an invoice paid on day d
$N_{d,i}$ = Number of days between the posting and the clearing date of the invoice
D = Today

How Days Payable Outstanding in the Top-Left Corner of the App Is Calculated

The app calculates the days payable outstanding in the following way:

1. The app finds all the paid invoices from 365 days ago till today.
2. For each such invoice, the app multiplies the invoice amount by the number of days between the posting and the clearing date of the invoice.

3. The app adds up the product from each multiplication.

4. The app divides the sum by the total amount of all these invoices.

The quotient is the days payable outstanding from 365 days ago till today.

Example: **Example**

Suppose today is Jan 18, 2017.

On the app tile, the app displays the days payable outstanding for January, February, and March of 2016.

In the top-left corner of the app, the app displays the days payable outstanding from Jan 18, 2016 till today.

Days Payable Outstanding - Detailed Analysis

With this analytical app you can conduct a detailed analysis of your days payable outstanding (DPO). You can use the predefined analysis steps to view your DPO by company code, supplier, and country of supplier. You can look at those trends over time and focus your analysis by using the filters to drill down.

Key Features

- Save your most frequently used analysis paths
- Filter by company code, supplier, accounting clerk, country, and period range

Supported Device Types

- Desktop
- Tablet

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Days Payable Outstanding – Indirect Method

With this analytical app you can view your days payable outstanding (DPO), or the average number of days it takes you to pay your suppliers.

Calculation Logic

This app calculates DPO on an aggregate level, rather than on the level of individual documents. It calculates DPO for the last 12 months using rolling monthly averages for the accounts payable balance and purchases. In the app, you specify the following parameters to calculate those rolling monthly averages:

- Months for Calculation of Rolling Average for Payables
- Months for Calculation of Rolling Average for Purchases

These two parameters can have the same value or different values. The number of months (X) you specify means that to calculate the average for that month, the app uses the value for that month and the previous X months. This applies to each month in the 12-month period and results in the rolling average. Note that using a fewer number of months can result in more monthly variance.

Key Features

- See your DPO by time
- See your DPO by company code
- See your DPO for all your suppliers or your top 10 suppliers by highest DPO

ℹ Note

This app contains in-app help for key fields and concepts. To display the help while working in the app, press F1 or click the question mark displayed in the app header.

Supported Device Types

- Desktop
- Tablet

Display Supplier Balances

You can use this app to display supplier balances and compare sales. You can see debits, credits, and balances by company code, fiscal year, and supplier. The app allows you to further analyze the amounts by displaying all related line items. Furthermore, you can compare the purchases between two fiscal years. To adapt the app to your needs, you can hide, unhide, and sort columns. In addition, you can create search and display variants.

Key Features

You can use this app to do the following:

- Display balances, debits, credits, and imputed interest
- Search by company code, fiscal year, and supplier
- Compare the purchases of the current and a comparison fiscal year
- Display balances and purchases in the company code currency or in the functional code currency
- Personalize the tables by adding or removing columns
- Export data to a spreadsheet

You can extend the app according to your business needs for different aspects. For this purpose, the following extensibility options are available:

Extension Points

There are various extension points available that you can use to add content to the user interface of the app, for example, fields, tabs, and columns.

Extension Points

To add a customer field to the app, for example, the following extensibility entities are available on the different software layers. You have to extend each of these entities according to your specific business needs:

UI		Back End/ABAP		
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (in DDIC Structure)	Runtime: Superclass/ Method to Be Redefined
`S1.view.xml`	`PanelSelectionInput` Extends the beginning of the input fields.	`FAP_VENDOR_BALANCE`	not available	not available
`S1.view.xml`	`PanelSelectionButtons` Extends the beginning of the button list.	`FAP_VENDOR_BALANCE`	not available	not available
`S1.view.xml`	`IconTabBar` Extends the beginning of the icon tab bar.	`FAP_VENDOR_BALANCE`	not available	not available
`S1.view.xml`	`AddColumnBalances`	`FAP_VENDOR_BALANCE`	not available	not available

UI		Back End/ABAP		
View	Extension Point	Design Time: Gateway Entity	Design Time: Extension Include (in DDIC Structure)	Runtime: Superclass/ Method to Be Redefined
	Extends the view after the last column of the Balances table.			
S1.view.xml	AddCellBalances Extends the view after the last cell of the Balances table.	FAP_VENDOR_BALANCE	not available	not available
S1.view.xml	AddColumnSpecialGL Extends the view after the last column of the Special G/L table.	FAP_VENDOR_BALANCE	not available	not available
S1.view.xml	AddCellSpecialGL Extends the view after the last cell of the Special G/L table.	FAP_VENDOR_BALANCE	not available	not available
S1.view.xml	AddColumnCompareBalances Extends the view after the last column of the Compare Balances table	FAP_VENDOR_BALANCE	not available	not available
S1.view.xml	AddCellCompareBalances Extends the view after the last cell of the Compare Balances table.	FAP_VENDOR_BALANCE	not available	not available

Further Extensibility Entities

Business Add-Ins (BAdIs)

The following BAdI is available for extensibility purposes:

FAP_VENDOR_BALANCE

If you have added fields to the UI and to the OData service, you can use this BAdI to modify the values of these fields.

The enhancement spot is ES_FAP_VENDOR_BALANCE.

Extension Includes

In addition to the extension includes described above, the following extension includes are available:

DDIC	Extension Include	Use
FAPO_S_VB_VENDOR_BALANCES_MD	INCL_EEW_FAPO_S_VB_VENDOR_BAL	This extension include allows you to add additional properties, which will appear as additional columns in the table view of the app.

UI Controller Hooks

To plug in and execute custom code, the following hooks are available in the controller code:

Controller	Hook	Use
`S1.controller.js`	`extHookOnInit`	Allows you to configure a custom initialization.
`S1.controller.js`	`extHookOnExit`	Is called when the view is closed; used to free resources and finalize activities.

For more information, see **SAP Library for User Interface Add-On for SAP NetWeaver** at https://help.sap.com/nw-uiaddon under **SAPUI5: UI Development Toolkit for HTML5** > **Extending Apps**.

Display Supplier List

Use

With this app you can display and download a list of suppliers. You can use the search filters to create custom lists of suppliers to provide to stakeholders and auditors.

Key Features

- View contact details for your suppliers
- Create custom lists of obsolete suppliers, blocked suppliers, or suppliers based on payment method
- Access the bank details and payment methods for your suppliers

Supported Device Types

- Desktop
- Tablet

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Country/Region-Specific Extensions

The following country/region-specific extensions are available in the **Display Supplier List** app when using a company code that is relevant in the given country/region:

Country/Region	Description of Extension

Country/Region	Description of Extension
Thailand	You can add the fields **Branch Code** and **Branch Code Description** as a filter in Adapt Filters for the app and export the corresponding columns to spreadsheets.

Display Process Flow - Accounts Payable

With this app you can display the relationships between Accounts Payable (AP) documents, including purchase orders, goods movements, incoming invoices, journal entries, and clearing entries.

Key Features

- Display the process flow from a specific document
- Access the details for individual documents

Supported Device Types

- Desktop
- Tablet

More Information

- The SAP Fiori apps reference library has details about the content necessary for giving users access to an app on the **SAP Fiori launchpad**. The SAP Fiori apps reference library is available here: https://fioriappslibrary.hana.ondemand.com

  To see this app's Fiori content, search for the app. Then select SAP S/4HANA as the product. On the **Implementation Information** tab, select the correct release. The details are in the **Configuration** section.

Future Payables

Use

With this app you can drill down to check on the top 10 amounts payable and the numbers of open items for the relevant suppliers. In addition, you can view the future amounts payable in a chart or a table according to company code, supplier, country and region of the supplier, account group of the supplier, and payment blocking reason.

Calculation Logic

The numbers on the app tile and in the top-left corner of the app indicate the total amount of all the payables that are due in the future.

The total payable amount is the sum of overdue payables and future payable.

Key Features

- View accounts payable by due periods

You can analyze accounts payable according to the predefined due periods. For each due period, you can drill down further to the ten suppliers who have the most amounts payable.

You can customize these due periods. In the **Add Evaluation – Variant** step of the SAP Smart Business Modeler, you can specify four due periods to group your future payables. In the default display, the period structure is as follows: 30 days (period 1), 60 days (period 2), and 90 days (period 3). This means, for example, that period 2 displays the payables with a due date between 31 and 60 days in the future.

- View top 10 amounts payable by suppliers

  You can analyze the top ten suppliers who have the highest amounts payable and check the numbers of open items for these suppliers.

- View accounts payable by company codes

  You can analyze future accounts payable according to company codes. For each company code, you can drill down further to the top ten suppliers who have the most amounts payable.

- Filter accounts payable by payment blocking reasons

  You can filter accounts payable according to payment blocking reasons. For example, you can choose a certain reason why the supplier is blocked, and check for the supplier names.

- Specify the key date for data analysis.

  This analytical app uses a single date as its key date. You can choose from the existing list of key dates in this app or create additional key dates using the Manage Date Functions app. You can create a single date or a date range as a key date.

  To define key dates, you must be assigned a role that has the same minimum authorization and business catalogs as the **Analytics Specialist** (`SAP_BR_ANALYTICS_SPECIALIST`) business template role.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

This app uses the `C_APFUTUREACCOUNTSPAYABLE` CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

Supported Device Types

Invoice Processing Analysis

Use

With this app you can view the total amount of posted invoices and the total number of posted line items.

Calculation Logic

The numbers on the app tile indicate the total amount of invoices posted in certain months in a certain period.

The number in the top-left corner of the app indicates the total amount of invoices posted in a certain period.

Key Features

- View the total amount of invoices and the total number of line items posted in a certain month
- View the total amount of invoices and the total number of line items posted for a certain supplier
- View the total amount of invoices and the total number of line items posted by a certain user
- View the total amount of invoices and the total number of line items posted in each processing status

  The possible statuses are as follows:

  - **Free for Payment** (open line items with no payment block)
  - **Cleared** (cleared line items)
  - **Blocked** (open line items with payment block)
  - **Parked** (parked line items)

ℹ Note

Grace period is included in the calculation of the net due date.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

This app uses the `C_APINVOICEPROCGANALYSIS` CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

Overdue Payables

Use

With this app you can check the overdue payable amount to your suppliers by supplier company code, supplier group, supplier, and reason for payment block. You can monitor the status of the overdue payments for critical suppliers in your area of responsibility. You can also find out about the potential risks and notify the responsible persons to take action.

Calculation Logic

You define a threshold, in percentage points, that determines when the overdue payment to a supplier should be considered critically overdue. If the proportion of the overdue amount to the total payable amount is equal to or greater than the threshold, the overdue payment is critically overdue. If the proportion is less than the threshold or if you do not specify a threshold, the overdue payment is uncritically overdue.

ℹ Note

Open payables that are due today are also included in the calculation.

The default threshold is 60. To specify another value, launch the **Define Thresholds for Vendor Account Groups** Customizing activity under **Financial Accounting (New)** > **Accounts Receivable and Accounts Payable** > **Vendor Accounts** > **Overdue Payables** > **Define Thresholds for Vendor Account Groups**. Alternatively, you can also use the `P_CriticallyOverdueThreshold` input parameter to define the threshold.

ℹ Note

If you define a threshold both in the Customizing activity and in the input paramater, the former overwrites the latter.

The numbers on the app tile indicate the total amount of critically overdue payables and that of uncritically overdue payables. The number in the top-left corner of the app indicates the total amount of critically overdue payables.

Overdue payables is the sum of critically overdue payables and uncritically overdue payables.

The total payable amount is the sum of overdue payables and future payable.

Key Features

- Display the overdue payable amount and the payable amount that is not yet overdue.
- Distinguish between critically overdue amount and uncritically overdue amount.
- Analyze the payable amount by different views, including company code, supplier group, reason for payment block, and supplier.
- Break down the overdue payable amount to four intervals before today when you analyze the amount by supplier.

  ### Example

  You define the interval as 30 days. The app then displays the overdue payable amount that is 30 days before today, 60 to 30 days before today, 90 to 60 days before today, and 120 to 90 days before today, respectively.

- Specify the key date for data analysis.

  This analytical app uses a single date as its key date. You can choose from the existing list of key dates in this app or create additional key dates using the Manage Date Functions app. You can create a single date or a date range as a key date.

  To define key dates, you must be assigned a role that has the same minimum authorization and business catalogs as the **Analytics Specialist** (`SAP_BR_ANALYTICS_SPECIALIST`) business template role.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

This app uses the `C_APOVRD` CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

Supplier Payment Analysis (Open Payments)

Use

With this app you can get an overview of the open payments to the accounts payable manager. You can view the payment data by different dimensions, including company code, supplier, currency, and user.

Calculation Logic

The numbers on the app tile and in the top-left corner of the app indicate the total amount of payments that are not cleared with invoices.

Key Features

- Display the aggregated data for all payment documents that are currently not reconciled with invoices.
- Display data in different colors (green for down payments, blue for all other open payments).
- Display payment data in different dimensions (by company code, supplier, currency, or user).
- Filter data by company code, supplier, or currency.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

For payments, the posting key in the supplier line has the indicator **Posting Key Used in a Payment Transaction**.

For down payments, **Special G/L Transaction Type** is set to A.

Other open payments are all payments (excluding down payments), which are not reconciled with invoices. They also include open positions of residual payment documents (negative payment amount is shown if the residual payment amount is less than the invoice amount, otherwise the system will show a positive amount). Partial payments are not included into open payments if they are posted against an invoice.

This app uses the C_APVENDOROPENITEMS CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

Supplier Payment Analysis (Manual and Automatic Payments)

Use

With this app you can view the payment data by different dimensions, including company code, supplier, currency, and user.

Calculation Logic

The equation below illustrates how the numbers on the app tile and in the top-left corner of the app are calculated and is followed by an explanation:

$$T = \sum_{d=D-365}^{D} \sum_{i=1}^{n} P_{d,i}$$

Where

T = Total amount of payments posted manually or automatically from 365 days ago till today
$P_{d,i}$ = Amount of a payment posted manually or automatically on day d
D = Today

How Payments for Last Year Is Calculated

Payments for last year is the total amount of payments posted manually or automatically from 365 days ago till today.

Key Features

- Display the aggregated data for all payment documents posted during a specific period (defined by user in KPI).

- Display data in different colors (green – for automatic payments, blue – for manual payments).
- Display payment data in different dimensions (by company code, supplier, currency, or user).
- Filter data by company code, supplier, and currency.

In addition, the app supports the following technical features and options:

- If your company uses SAP Jam, you can post comments there. You can also send emails from this app.

For payments, the posting key in the supplier line has the indicator **Posting Key Used in a Payment Transaction**. For down payments, the special G/L transaction type is set to A.

Automatic payments are all payments that are posted directly by transaction `F110` (these payments have a transaction code `F110` in the header). Manual payments are all other payments.

This app uses the `C_APMANUALPAYMENTS` CDS view.

Caching is enabled for this app for better performance. You can click the refresh icon on the app tile and in the bottom-left corner of the app to refresh the data immediately. The data is also updated automatically. The frequency is determined by the cache duration in the tile configuration. For more information, see *Caching* in Creating Applications.

Supported Device Types

- Desktop
- Tablet

Navigation Targets

The app enables users to access other apps directly (for example to display detailed information).

ℹ Note

These linked apps have to be already available in your system landscape or you have to implement them along with this app.

Display Item Change Log

With this app you can see details of changes made to all journal entries relevant to your role. The app displays changes to all log-enabled fields in the relevant documents, and you can easily see what was changed, by whom, and when.

This gives you demonstrable oversight of all changes made to journal entries within your area, which can be useful in relation to auditing.

Key Features

- Customer / Supplier items automatically filtered based on your role assignment
- See changes to general documents, parked documents, previously parked documents, recurring entry documents, and sample documents
- Use with SAP CoPilot for a quick way to contact colleagues to clarify the reasons for changes to documents

Supported Device Types

- Desktop
- Tablet
- Smartphone

Adjustment of Withholding Tax Information to Relevant Types

Schedule adjustments to withholding tax information.

With this job template, you can schedule Adjustment to Withholding Tax Information following changes to master data or changes to withholding tax information for the company code or business partner.

Key Features

Adjust open and cleared items in the system to change the relevant withholding tax types so that the items can be activated

Selection Parameters

Enter the following mandatory selection parameters:

Mandatory Parameters

Use this parameter	To
Company Code	Specify the company if you have changed the withholding tax data for the company code..

If you choose to specify the parameters manually, configure one or more of the following advanced parameters:

Advanced Parameters

Use this parameter	To
Customer	Specify the IDs of the customers with changed withholding tax information.
Supplier	Specify the IDs of the suppliers with changed withholding tax information.
Document Number	Restrict the selection to documents in a specified range.
Fiscal Year	Restrict the selection to fiscal years in a specified range.
Posting Date	Restrict the selection to posting dates in a specified range..
Normal Documents	Select the checkbox to perform adjustments to standard documents.
Parked Documents	Select the checkbox to perform adjustments to parked documents.
Recurring Documents	Select the checkbox to perform adjustments to recurring documents.
Document No. of Recurring Doc.	Restrict the selection to documents in a specified range.
Test Mode	Select the checkbox to run the job in test mode. Test mode allows you to check the results without actually adjusting the tax code.
Also down payments and partial payments with withhold tax code	Select the checkbox to perform adjustments to down payments and to partial payments with this withholding tax code.

Supported Device Types

Automatic Scheduling of the Payment Program

In this background job, you enter the parameters for automatic payments before the payment run.

Key Features

- Specify the day for which you want to schedule the payment run.
- Specify which documents you want to include in the payment run.
- Specify the payment methods to use for the payment run.
- Specify the additional information about the payment run that you want to keep in the log.

Selection Parameters

Enter the following mandatory selection parameters to specify for which customers you want to create the payment run:

Mandatory Parameters

Use this parameter	To specify
Identification	An alphanumeric key to uniquely identify the payment run. This key is used to distinguish between the payment runs that are scheduled for the same day.
Company Code	The four-character company codes that you want to pay.
Payment Method	The keys of the payment methods that are to be used for every company code or company code interval in the payment run.
Next Posting Date	Posting date of the next payment run. Enter the number of days after the run date. This date is needed in order to check the due date of payables. If an item is already overdue on the date of the next payment run, or would make you lose cash discounts, the system pays the item in this payment run.

Enter one or more of the following additional optional parameters:

Optional Parameters

Use this parameter	To specify
Run Date	The date on which you plan to carry out the payment run. Enter the number of days after today. However, a payment run at an earlier or later date is also possible.
Proposal Run	Whether to carry out the run as a proposal run. If there are no errors from the proposal run, then carry out a payment run.
Docs Entered Up To	The date up to which documents should be considered in the payment run. The creation date and not the posting date is definitive here. Open items entered after this date are not processed in the payment run.
Customer Items Due By	The date by which an open customer item must be due in order to be included in the payment run.
Posting Date	The date that is used when entering the document in Financial Accounting or Controlling. This is the date to be printed on the payment media.

Use this parameter	To specify
	The posting date can differ from both the entry date (day of entry into the system) and the document date (day of creation of the original document).
Supplier	The account number of the supplier.
Customer	The account number of the customer.
Exchange Rate Type	The exchange rate type that you want to use for translating payment amounts from foreign currency to local currency.
Field	The name of the field that you want to use as an additional selection criterion.
Ignore	Whether to exclude the values you enter for the field.
Values	The values for the field. If the list of values is too long, you can continue on the second line.

Additional Log

The following table explains the fields in this section:

Use this field	To specify
Due Date Check	Whether to log whether an item is due. This information helps you analyze why a certain item is not included in a payment proposal. If an item is not due, it is not included in the payment proposal.
Payment Method Selection in All Cases	Whether to log the selection of the payment method and the bank.
Payment Method Selection if Unsuccessful	Whether to log the attempted selection of the payment method and the bank if no permissible payment method or bank is found.
Line Items of the Payment Document	Whether to log the line items of the payment document.
Supplier	The account number of the supplier.
Customer	The account number of the customer.

ℹ Note

To enable an improved performance when using this job template to schedule a payment run, the job log has been simplified to keep only the job ID and status. The detailed job log can be viewed in the **Manage Automatic Payments** app.

Supported Device Types

- Desktop

Related Information

Manage Automatic Payments

Creation of Positive Pay Files

You can use this template to create a file of check information that belongs to a paying company code.

Key Features

- Define whether to create a file for checks from Payroll Accounting or Financial Accounting.
- Define which checks to include in the file: checks that are not yet extracted, checks from a payment run, checks from a previous extract, or checks that match certain selection criteria.
- Define the output format of the file.
- Send the file via an API.

Selection Parameters

The following table lists the mandatory parameters for this job template:

Mandatory Parameters

Parameter	Use
Paying Company Code	Specifies the paying company code to which the checks belong.
House Bank	Specifies the house bank to which the checks belong.
Currency	Specifies the currency in which the checks shall be displayed in the file.
Payt Mdm Format	Specifies the payment medium format to use for the file. The format determines the structure of the file.

The following table lists the optional parameters for this job template:

Optional Parameters

Parameter	Use
Payroll Checks	Specifies the type of checks to be processed. If you select this parameter, checks from Payroll Accounting are processed. Otherwise, checks from Financial Accounting are processed.
Checks not Extracted	Specifies that you want the file to include only the checks that have not yet been extracted. Both checks that are new in the system and those that were previously extracted but have since changed, for example voided, are included.
Checks from Payment Run	Specifies that you want the file to include checks from a payment run.
Run Date	Specifies the date on which the payment run is carried out.
Identification	Distinguishes between several payment runs that are carried out on the same day.
Checks from an Extract	Specifies that you want the file to include checks from a previous extract.

Parameter	Use
Extract Creation Date	Specifies the date on which the extract is created.
Extract Creation Time	Specifies the time when the extract is created.
All checks according to further selection criteria	Specifies that you want the file to include checks that match the criteria you define in the Further selections section.
Account ID	Uniquely defines a bank account together with a house bank.
Check Number From	Specifies the lower limit of the check number lot.
Check Number To	Specifies the upper limit of the check number lot.
Amount Paid	Specifies the amount paid in the payment currency.
Date of Issue	Specifies the date on which the check is issued.
Creation Date	Specifies the date on which the check is created.
Payment Method	Filters for the check payment method.
Void Reason Code	Specifies why a check is not used as a means of payment. If you enter the initial value 00 for this parameter, only valid checks will be selected.
Use API	Specifies whether to send the file via the Positive Pay File - Send API.
SAP Multi-Bank Connectivity	Specifies whether you want to send data via SAP Multi-Bank Connectivity.

Supported Device Types

- Desktop

Recreate and Change Withholding Tax Data with Withholding Tax Rate of 0%

With this job template, you can recreate and change withholding tax data with a withholding tax rate of 0% for documents and payments posted without withholding tax during the specified fiscal year.

Key Features

- Create withholding tax data for reconciled and open items in cases when suppliers or customers who were not liable for withholding tax become liable for withholding tax at a rate of 0%
- Change withholding tax data in reconciled and open items with existing withholding tax data. To do this, the tax rate of the existing withholding tax data and the tax rate of the new withholding tax code must both be 0%.

Selection Parameters

To specify the parameters manually, configure one or more of the following advanced parameters:

Advanced Parameters

Use this parameter	To
Customer	Specify the ID of the customer with changed withholding tax information.
Tax Number 1	Specify the customer tax identification number
Tax Number 2	Specify the customer tax identification number
Supplier	Specify the IDs of the suppliers with changed withholding tax information
Tax Number 1	Specify the supplier tax identification number
Tax Number 2	Supplier tax identification number
Company Code	Specify the company codes of the company for which you have changed the withholding tax data
Document Number	Restrict the selection to documents in a specified range
Posting Date	Restrict the selection to posting dates in a specified range
Only recreate documents without withholding tax data	Select this checkbox to recreate only those documents without withholding tax data
Invoice Documents/Payment Documents	Recreating or changing withholding tax data requires that you first execute the invoice program and then, in a subsequent step, execute the payments program
Test Mode	Select the checkbox to run the job in test mode. Test mode allows you to check the results without actually adjusting the tax code.

Supported Device Types

- Desktop

Reverse Payment Run

You can use this template to reverse all the payment documents in a payment run. You may have to do this, for instance, if you entered an incorrect posting date for the payment run.

Key Features

- Reverse the payment documents immediately or at a specified time later.
- Specify a reason for the reversal.
- Exclude certain payment documents from the reversal.

ℹ Note

You cannot reverse the payment documents in a payment run if any of the following conditions are met:

- You have already created payment media.
- The system has already created entries in the payment register or in the check register.

- The payment is already in the approval process in the Approve Bank Payments app.

Selection Parameters

The following table lists the mandatory parameters for this job template:

Mandatory Parameters

Parameter	Use
Run Date	Specifies the date on which the payment that you want to reverse ran.
Identification	Specifies the alphanumeric key that uniquely identifies the payment run that you want to reverse among all the payment runs that were scheduled for the same day.
Reversal Reason	Specifies a reason for reversing the payment run.

The following table lists the optional parameters for this job template:

Optional Parameters

Parameter	Use
Test Run	Specifies whether to run the job as a test run. • If this checkbox is selected, the system only generates a log. Data is neither updated nor changed in the database. • If this checkbox is not selected, the system updates data in the database. **Note** SAP recommends that you perform a test run before performing an actual run. This allows you to check the log and find out whether there are any errors in the test run. An error can occur as described in the note in the Key Features section. If there is an error, you can use the Reset Cleared Items app to reset payment documents.
Posting Date	Specifies the date for entering the reversed documents in Financial Accounting or Controlling.
Posting Period	Specifies the period for posting the reversed documents.
Payment Document No.	Specifies the payment documents that you do not want to reverse via this job.

Supported Device Types

Desktop

SAP Digital Payments: Advice Processing

With this background job, you can compile a list of all transactions that took place in a specific time frame then post them as a bank statement.

This simplifies the clearing of digital payments on your house bank account.

ⓘ Note

Please note that if you want to use the SAP digital payments add-on you will need a separate license. For further information, please contact your SAP Account Executive.

Key Features

- Post the bank statement to a virtual bank account representing the relevant payment method and currency.
- Consolidate the items on the credit card clearing account to simplify the clearing of the final credit card settlement on your house bank account.
- Consolidate the items on the external payment clearing account to simplify the clearing with your house bank account.

Selection Parameters

Make entries for all parameters as follows:

Parameter	Explanation
Bank Key	Specify the relevant bank key. The bank key is a virtual bank number that represents the relevant digital payment method. There is one house bank account for each currency.
Bank Country/Region	Specify the relevant country/region for this bank key.
Transactions From	Specify the start of the time frame you want to use.
Transactions To	Specify the end of the time frame you want to use.
Digital Payment Method	Specify which type of transactions should be processed by the run. You can choose between `Credit Card` and `External Payment`. External payments are digital payments not involving credit cards.
Payment Service Provider, Merchant Alias	Merchant accounts may belong to different company codes. To fetch advice data by company code, select the payment service provider and merchant alias for which you want to fetch advice data.
Do Not Check Merchant Alias	If you select this checkbox, no check will be performed as to whether the merchant alias corresponds to a bank account in your system. If you do this, the system will not automatically determine payment service provider and merchant alias from a bank account.
Reconciliation	If you don't select this field, all transactions that were already processed and posted are ignored. This avoids double postings. If you select this field, all transactions are processed and posted. Double postings may occur but are sometimes necessary, for example when an advice has been canceled in SAP S/4HANA.

Application Log

An application log is available if you want to see details of the advice runs. To access this log, use transaction SLG1 with the following entries:

- Object: FIAR
- Subobject: FIAR_DP_ADVICE

Supported Device Types

Desktop

Related Information

Handling Merchants Using the SAP Digital Payments Add-On With Accounts Receivable

SAP Digital Payments: Advice Processing (Obsolete)

With this background job, you can compile a list of all transactions that took place in a specific time frame then post them as a bank statement.

This simplifies the clearing of digital payments on your house bank account.

ℹ Note

Please note that if you want to use the SAP digital payments add-on you will need a separate license. For further information, please contact your SAP Account Executive.

Key Features

- Post the bank statement to a virtual bank account representing the relevant payment method and currency.
- Consolidate the items on the credit card clearing account to simplify the clearing of the final credit card settlement on your house bank account.
- Consolidate the items on the external payment clearing account to simplify the clearing with your house bank account.

Selection Parameters

Make entries for all parameters as follows:

Parameter	Explanation
Bank Key	Specify the relevant bank key. The bank key is a virtual bank number that represents the relevant digital payment method. There is one house bank account for each currency.
Bank Country	Specify the relevant country for this bank key.
Transactions From	Specify the start of the time frame you want to use.
Transactions To	Specify the end of the time frame you want to use.
Digital Payment Method	Specify which type of transactions should be processed by the run.

Parameter	Explanation
	You can choose between `Credit Card` and `External Payment`. External payments are digital payments not involving credit cards.

Application Log

An application log is available if you want to see details of the advice runs. To access this log, use transaction `SLG1` with the following entries:

- Object: `FIAR`
- Subobject: `FIAR_DP_ADVICE`

Supported Device Types

Desktop

Create and Send Payment Advices to Payees

In this background job, you create payment advices and send them to your suppliers.

Your payment advices show the payments that have been made by you and include a reference to the corresponding invoices. You send payment advices to suppliers to make it easier for them to process their bank statements.

You use this background job if an automatic payment run in the Manage Automatic Payments app fails or if you want to re-create payment advices and then send them to the suppliers.

Key Features

- Specify whether to create and send payment advices immediately or at a scheduled time later.
- Specify a run date and an identification for the payment run. All the items in the payment proposal will the included in the payment run and payment advices will be created for all the items.
- Specify a specific batch number for the payment run. Only the items in the batch will the included in the payment run and payment advices will be created only for these items.

ℹ Note

You can either specify a run date and an identification and leave the batch number blank, or do it the other way around.

Background Information

When you configure the output of payment advice documents, you can set the following dispatch times:

- **1 (Immediately)**
- **2 (Scheduled)**

You can also set the following output channels:

Output Type	Channel
PAYM_ADV_CXML (Payment Advice via Ariba)	XML (XML)
PAYM_ADV_EDI (Payment Advice via EDI channel)	EDI (EDI)

For more information, see Configuring the Output of Payment Advice Forms.

The two settings lead to the following results:

- If you set the dispatch time to **1 (Immediately)**, as soon as the payment advices are created after payment runs in the **Manage Automatic Payments** app, they are sent via the Ariba network or via the EDI channel to the suppliers.
- If you set the dispatch time to **2 (Scheduled)** and the output channel to **XML (XML)** or **EDI (EDI)**, the payment advices that are created after payment runs won't be sent via the Ariba network or via the EDI channel to the suppliers immediately. You run the Send Scheduled Payment Advices to Payees background job to specify when to send them.

Selection Parameters

The table below lists the main selection parameters for this background job:

Main Parameters

Use this parameter	To specify
Run Date	The date on which you plan to carry out the payment run.
Identification	An alphanumeric key to uniquely identify the payment run. This key is used to distinguish between the payment runs that are scheduled for the same day.

The table below lists the optional selection parameters for this background job:

Optional Parameters

Use this parameter	To specify
Batch Number	A segment of the items in a payment run. Multiple batches might be created after a payment run.
Supplier	The suppliers to whom you want send the payment advices.
Customer	The customers to whom you want to send the payment advices.
Payment Document Number	The document number of the payments you want to include in the payment advices.
Output Channel	The channel in which you want to send the payment advices.

Supported Device Types

Desktop

Send Scheduled Payment Advices to Payees

Use

Use this job template to schedule a background job to send payment advices to suppliers. When you set up the job, you can send them via the Ariba Network.

Your payment advices show the payments that have been made by you and include a reference to the corresponding invoices. You send payment advices to suppliers to make it easier for them to process their bank statements.

Key Features

- Schedule the background job using the following parameters:

Channel	Output Type
XML	`PAYM_ADV_CXML` (Payment Advice via Ariba)
EDI	`PAYM_ADV_EDI` (Payment Advice via EDI channel)

- The **Scheduling Options** dialog allows you to do the following:
  - Define the recurrence pattern of the background job
  - Limit the job to run on working days only

Supported Device Types

- Desktop

Data Management in Invoice Management

In this section, you can find the functions available for managing your data.

- Blocking and Deletion of Personal Data in Invoice Management
- Data Destruction in Invoice Management

Related Information

Data Management in SAP S/4HANA

Blocking and Deletion of Personal Data in Invoice Management

The following archiving objects are available in Invoice Management:

- Archiving Bank Communication Management Using BNKCOM_ARC
- Archiving Checks Using FI_SCHECK
- Archiving Payment Requests Using FI_PAYRQ
- Archiving Payment Release List Items Using FI_FPRL

Archiving Bank Communication Management Using BNKCOM_ARC

You can use the archiving object BNKCOM_ARC for archiving bank communication management.

Tables

BNKCOM_ARC archives data from several tables. To check which tables these are, call up transaction SARA, enter the archiving object, and choose **Database Tables**. You can display the relevant tables in the lower part of the screen.

Archiving Classes

BNKCOM_ARC may trigger further archiving classes to write additional data, for example change documents, into the archive. To check which classes these are, call up transaction AOBJ, select your archiving object and choose **Archiving Classes Used**.

Programs

To find out which programs this archiving object offers, call up transaction SARA enter the archiving object and press ENTER.

Prerequisites

The following prerequisites must be fulfilled before a bank communication management batch can be archived:

- The date of the file generation of the selected batches must be within a posting period that is closed for postings in financial accounting.
- The following checks have been carried out:
  - Approval workflow (mandatory)
  - Payment document (optional)

ILM-Related Information for the Archiving Object

You can use this archiving object with the BNKCOM_ARC ILM object as part of SAP Information Lifecycle Management. In transaction IRMPOL, you can create policies for residence or retention rules, depending on the available policy category. Here you can also see the available time references and which condition fields exist, and decide which of them shall be used in which order to define your rule structure.

The following condition fields are available:

- Standard Field Country from Company Code BS_COUNTRY_OF_BUKRS
- Paying Company Code BUKRS
- Created ON CRDATE

The following time references are available:

- Created On CREATION_DATE

For more information, see SAP Information Lifecycle Management.

Defining Write Variants

When you schedule the archiving run, you must enter an existing variant or create a new one. You can do so in transaction SARA.

A write variant contains the parameters for the bank communication management that you want to archive.

SAP delivers the following parameters:

- Batch Currency
- Batch Number
- Batch Amount
- No. of Payments
- File Date
- Rule ID
- Paying Company Code

Defining Preprocessing Variants

The preprocessing program for BNKCOM_ARC sets 02 (Document set for archive) as the value for the **Archive Status** (ARCHIVE_STATUS) field in the **Batch Header** (BNK_BATCH_HEADER) table so that bank communication management can be archived.

Archiving Checks Using FI_SCHECK

You can use the archiving object FI_SCHECK to archive FI checks.

Tables

FI_SCHECK archives data from several tables. To check which tables these are, call up transaction SARA, enter the archiving object, and choose **Database Tables**. You can display the relevant tables in the lower part of the screen.

Archiving Classes

FI_SCHECK may trigger further archiving classes to write additional data, for example change documents, into the archive. To check which classes these are, call up transaction AOBJ, select your archiving object and choose **Archiving Classes Used**.

Programs

To find out which programs this archiving object offers, call up transaction SARA enter the archiving object and press ENTER.

Prerequisites

The following prerequisites must be fulfilled before an FI check can be archived:

- The check has been either cashed or voided.
- The cashing or voiding took place a certain number of days ago.
- The following checks have been carried out:
    - The following mandatory and optional checks are carried out on FI checks before they can be archived:

- Payment document (optional)

ILM-Related Information for the Archiving Object

You can use this archiving object with the FI_SCHECK ILM object as part of SAP Information Lifecycle Management. In transaction IRMPOL, you can create policies for residence or retention rules, depending on the available policy category. Here you can also see the available time references and which condition fields exist, and decide which of them shall be used in which order to define your rule structure.

The following condition fields are available:

-
  - Bank Country Key (BANKS)
  - Paying Company Code (BUKRS)
  - Country Key (LAND1)
  - Regional Code of the Payee (REGIO)
  - Payment Method (RZAWE)

The following time references are available:

- End of Fiscal Year (END_OF_FISCAL_YEAR)
- End of Year (END_OF_YEAR)
- Posting Date (POSTING_DATE)

For more information, see SAP Information Lifecycle Management.

Defining Write Variants

When you schedule the archiving run, you must enter an existing variant or create a new one. You can do so in transaction SARA.

A write variant contains the parameters for the FI checks that you want to archive.

SAP delivers the following parameters:

- Paying company code

  Specifies the company code the checks posted by which the system should reload data for.

- House bank

  Specifies the house bank the checks paid by which the system should reload data for.

- Account ID

  Specifies the account the checks paid from which the system should reload data for.

- Check number

  Specifies the number range the checks within which the system should reload data for.

- Payroll checks

Specifies which type of checks the system should select. If you set this indicator, the system selects only checks from Human Resources. Otherwise, it selects only checks from Financial Accounting.

- Number of days in the system

  Specifies the minimum number of days the checks must have been in the system.

- Key date

  Specifies the date before which the minimum numbers of days in the system is calculated. If you do not specify a value, today becomes the key date.

Archiving Payment Requests Using FI_PAYRQ

You can use the archiving object FI_PAYRQ to archive payment requests.

Tables

FI_PAYRQ archives data from several tables. To check which tables these are, call up transaction SARA, enter the archiving object, and choose **Database Tables**. You can display the relevant tables in the lower part of the screen.

Archiving Classes

FI_PAYRQ may trigger further archiving classes to write additional data, for example change documents, into the archive. To check which classes these are, call up transaction AOBJ, select your archiving object and choose **Archiving Classes Used**.

Programs

To find out which programs this archiving object offers, call up transaction SARA enter the archiving object and press ENTER.

Prerequisites

The following prerequisites must be fulfilled before a payment request can be archived:

- The payment request is cleared, that is, either it is canceled or a payment has been made for it.
- The clearing took place a certain number of days ago.
- The following checks have been carried out:
  - The following mandatory and optional checks are carried out on <business objects> before they can be archived:
  - Payment document (optional)

ILM-Related Information for the Archiving Object

You can use this archiving object with the FI_PAYRQ ILM object as part of SAP Information Lifecycle Management. In transaction IRMPOL, you can create policies for residence or retention rules, depending on the available policy category. Here you can also see the available time references and which condition fields exist, and decide which of them shall be used in which order to define your rule structure.

The following condition fields are available:

- Company Code (BUKRS)

- Business Area (GSBER)

The following time references are available:

- End of Fiscal Year (END_OF_FISCAL_YEAR)
- End of Year (END_OF_YEAR)

For more information, see SAP Information Lifecycle Management.

Defining Write Variants

When you schedule the archiving run, you must enter an existing variant or create a new one. You can do so in transaction SARA.

A write variant contains the parameters for the payment requests that you want to archive.

SAP delivers the following parameters:

- Company Code

  Specifies the company code under which the payment requests are posted.

- Key Number

  Specifies the interval within which the payment requests fall.

- Customer items

  Specifies that you want to archive payment requests for customers.

- Vendor items

  Specifies that you want to archive payment requests for suppliers.

- G/L account items

  Specifies that you want to archive payment requests for G/L accounts.

- Minimum Number of Days Since Clearing

  Specifies the minimum number of days for which the payment requests have been cleared.

Archiving Payment Release List Items Using FI_FPRL

You can use the archiving object FI_FPRL to archive payment release list items.

Tables

FI_FPRL archives data from several tables. To check which tables these are, call up transaction SARA, enter the archiving object, and choose **Database Tables**. You can display the relevant tables in the lower part of the screen.

Archiving Classes

FI_FPRL may trigger further archiving classes to write additional data, for example change documents, into the archive. To check which classes these are, call up transaction AOBJ, select your archiving object and choose **Archiving Classes Used**.

Programs

To find out which programs this archiving object offers, call up transaction SARA enter the archiving object and press ENTER.

Prerequisites

The following prerequisites must be fulfilled before a payment release list item can be archived:

- The payment release list item is in status **Refused**, **Paid** or **Exception**.
- The following checks have been carried out:
    - Payment document (optional)

ILM-Related Information for the Archiving Object

You can use this archiving object with the `FI_FPRL` ILM object as part of SAP Information Lifecycle Management. In transaction `IRMPOL`, you can create policies for residence or retention rules, depending on the available policy category. Here you can also see the available time references and which condition fields exist, and decide which of them shall be used in which order to define your rule structure.

The following condition fields are available:

- Item Status ID (`Status`)

The following time references are available:

- Last Changed On (`LAST_CHANGE_DATE`)

For more information, see SAP Information Lifecycle Management.

Defining Write Variants

When you schedule the archiving run, you must enter an existing variant or create a new one. You can do so in transaction SARA.

A write variant contains the parameters for the payment release list items that you want to archive.

SAP delivers the following parameters:

- Company Code

  Specifies the company code under which the payment release list items are posted.

- Status

  Specifies the status of the payment release list items. Possible statuses are **Refused**, **Paid**, and **Exception**.

- Minimum Number of Days

  Specifies the minimum number of days in which no changes have been made to the payment release list items.

Data Destruction in Invoice Management

Destroy data using destruction objects.

You use data destruction objects to destroy data for which the retention period has expired and there is no legal hold. You can destroy data by scheduling a data destruction run for a corresponding data destruction object.

The following data destruction objects are available in Invoice Management:

- Destroying Synchronization of Customer Master Data Using BP_FKREDEB_SYNC_DESTRUCTION
- Destroying Direct Debit Pre-Notifications Using FI_DD_PRENOTIF_DESTRUCTION

Destroying Synchronization of Customer Master Data Using BP_FKREDEB_SYNC_DESTRUCTION

You can use the data destruction object `BP_FKREDEB_SYNC_DESTRUCTION` for destroying synchronization of customer master data.

You can use this data destruction object with ILM object `BP_FKREDEB_SYNC_DESTRUCTION` as part of SAP Information Lifecycle Management.

Checks

The following application-specific checks are carried out on synchronization of customer master data before it can be destroyed:

- Check whether the leading supplier still exists. The destruction runs only if the leading supplier has been archived.

Prerequisites

The following prerequisites need to be fulfilled before any synchronization of customer master data can be destroyed:

- The ILM object has been assigned to an existing or new ILM audit area.
- An ILM policy and the required retention rules for the ILM object have been defined.
- One or more policies with policy status **Live** are available for the ILM object.

For more information, see:

- Processing Audit Areas
- Editing ILM Policies
- Editing Retention Rules

ILM-Based Information for the Data Destruction Object

You create policies and rules for the related ILM object of this data destruction object.

The following fields for the ILM object are defined in the ILM policy and are visible when creating or processing the **ILM Policies**:

- Available **Time References**
    - `CHANGE_DATE`: Date of Last Change
- Available **Condition Fields**

- KUNNR: Customer
- LIFNR: Supplier

Destroying Direct Debit Pre-Notifications Using FI_DD_PRENOTIF_DESTRUCTION

You can use the data destruction object FI_DD_PRENOTIF_DESTRUCTION for destroying direct debit pre-notifications.

You can use this data destruction object with ILM object FI_DD_PRENOTIF_DESTRUCTION as part of SAP Information Lifecycle Management.

Prerequisites

The following prerequisites need to be fulfilled before a direct debit pre-notification can be destroyed:

- The ILM object has been assigned to an existing or new ILM audit area.
- An ILM policy and the required retention rules for the ILM object have been defined.
- One or more policies with policy status **Live** are available for the ILM object.

For more information, see:

- Processing Audit Areas
- Editing ILM Policies
- Editing Retention Rules

ILM-Based Information for the Data Destruction Object

You create policies and rules for the related ILM object of this data destruction object.

The following fields for the ILM object are defined in the ILM policy and are visible when creating or processing the **ILM Policies**:

- Available **Time References**
  - RUN_DATE: Run date
- Available **Condition Fields**
  - DD_PRENOTIF: Direct Debit Pre-Notification
  - LAUFI: Identification
  - BUKRS: Paying company code
  - HBKID: House Bank
  - HKTID: Account ID
  - KUNNR: Customer
  - LIFNR: Supplier
  - RZAWE: Payment method

- WAERS: Currency

Receivables Management

Receivables Management combines the areas of Accounts Receivable Accounting, SAP Collections Management, SAP Credit Management, SAP Dispute Management, Advanced Payment Management, and Digital Payment Processing.

> **Note**
>
> If you want to use SAP Credit Management, SAP Dispute Management, or digital payment processing with the SAP digital payments add-on, you will need a separate license. For further information, contact your SAP Account Executive.

If you want to use SAP Fiori apps for your AR business processes, refer to the information in Accounts Receivable Accounting. This provides app-specific documentation and background information.

If you don't want to use SAP Fiori apps and are looking for help on SAP GUI transactions, please go to Accounts Receivable (FI-AR) and Accounts Payable (FI-AP).

Accounts Receivable (FI-AR) and Accounts Payable (FI-AP)

The **Accounts Payable** application component records and administers accounting data for all vendors. It is also an integral part of the purchasing system, where deliveries and invoices are managed according to vendors. The system automatically makes postings in response to the operative transactions. In the same way, the system supplies the Cash Management application component with figures from invoices in order to optimize liquidity planning.

Payables are paid with the payment program. The payment program supports all standard payment methods (such as checks and transfers) in printed form as well as in electronic form (data medium exchange on disk and electronic data interchange). This program also covers country-specific payment methods.

If necessary, dunning notices can be created for outstanding receivables (for example, to receive payment for a credit memo). The dunning program supports this function.

Postings made in Accounts Payable are simultaneously recorded in the general ledger where different G/L accounts are updated based on the transaction involved (such as payables and down payments). The system contains due date forecasts and other standard reports that you can use to help you monitor open items.

You can configure balance confirmations, account statements, and other notifications to suit your correspondence requirements. There are balance lists, journals, balance audit trails and other evaluations available for documenting transactions in Accounts Payable.

The **Accounts Receivable** application component records and administers accounting data of all customers. It is also an integral part of sales management.

All postings in Accounts Receivable are also recorded directly in the general ledger. Different G/L accounts are updated depending on the transaction involved (for example, receivables, down payments, and bills of exchange). The system contains a range of tools that you can use to monitor open items, such as account analyses, alarm reports, due date lists, and a flexible dunning program. The correspondence linked to these tools can be individually formulated to suit your requirements. This is also the case for payment notices, balance confirmations, account statements, and interest calculations Incoming payments can be assigned to due receivables using user-friendly screen functions or by electronic means such as EDI and data telecommunication.

The payment program can automatically carry out direct debiting and down payments.

There is a range of tools available for documenting the transactions that occur in Accounts Receivable, including balance lists, journals, balance audit trails, and other standard reports. When drawing up financial statements, the items in foreign currency are revalued, customers who are also vendors are listed, and the balances on the accounts are sorted according to remaining life.

Accounts Receivable is not merely a basis for adequate and orderly accounting. It also provides the data required for effective credit management, (as a result of its close integration with the Sales and Distribution component), as well as important information for the optimization of liquidity planning, (through its link to Cash Management).

To process receivables-related dispute cases, for example payment reductions, you can use the **SAP Dispute Management** component. For additional information, see SAP Dispute Management for FI-AR (FIN-FSCM-DM).

You can use the **SAP Collections Management** component for the collection of receivables. For more information, see SAP Collections Management (FIN-FSCM-COL).

ⓘ Note

SAP Dispute Management and **SAP Collections Management** are both part of **SAP ERP**, but a separate license is required for them.

Apps for Accounts Receivable (FI-AR) - Overview

Apps for Accounts Receivable Accountants

- Accounts Receivable Overview
- Cash Collection Tracker - Accounts Receivable
- Define Accounting Clerks
- Display Dunning History
- Display Customer Balances
- Manage Customer Line Items
- Manage Customer Down Payment Requests
- Post Incoming Payments
- Clear Incoming Payments
- Manage Bank Statements
- Reprocess Bank Statement Items
- Manage Processing Rules - For Bank Statements
- Manage Lockbox Batches
- Reset Cleared Items
- Reset Cleared Items - Payment Cards
- Manage Incoming Payment Files
- Manage Payment Advices
- Assign Open Items

- Display Process Flow - Accounts Receivable
- My Dunning Proposals
- Display Customer List
- Process Receivables
- Manage Promises to Pay
- Manage Resubmissions
- Manage Collection Contact Persons
- Manage Customer Contacts
- Manage Collections Emails
- Create Correspondence
- Process Collections Worklist
- Schedule Collections Management Jobs
- Display Collections Management Log
- Schedule Dispute Management Jobs
- Display Dispute Management Log
- Manage Assignment Proposals for Dispute Cases
- Schedule Accounts Receivable Jobs
- Display Payment Card Data
- Display Head Office Receivables

Apps for Accounts Receivable Managers

- Overdue Receivables
- Overdue Receivables in Dispute
- Overdue Receivables by Risk Class
- Allowance for Doubtful Accounts
- Cash Collection Tracker - Collections Management
- Doubtful Accounts Valuation
- Dunning Level Distribution

- Supplier Payment Analysis (Manual and Automatic Payments)
- Display Item Change Log

Supplier/Vendor Master Records: Environment

The following topics explain the function and structure of supplier/vendor master records.

What Data is Contained in the Supplier/Vendor Master Record?

Data in supplier/vendor master records controls how transaction data is posted and processed for a supplier/vendor. The supplier/vendor master record also contains all the data you require to do business with your suppliers/vendors.

The master record is used not only in Accounting but also in Materials Management. By storing supplier/vendor master data centrally and sharing it throughout your organization, you only need to enter it once. You can prevent inconsistencies in master data by maintaining it centrally. If one of your suppliers/vendors changes their address, you only have to enter this change once, and your accounting and purchasing departments will always have up-to-date information.

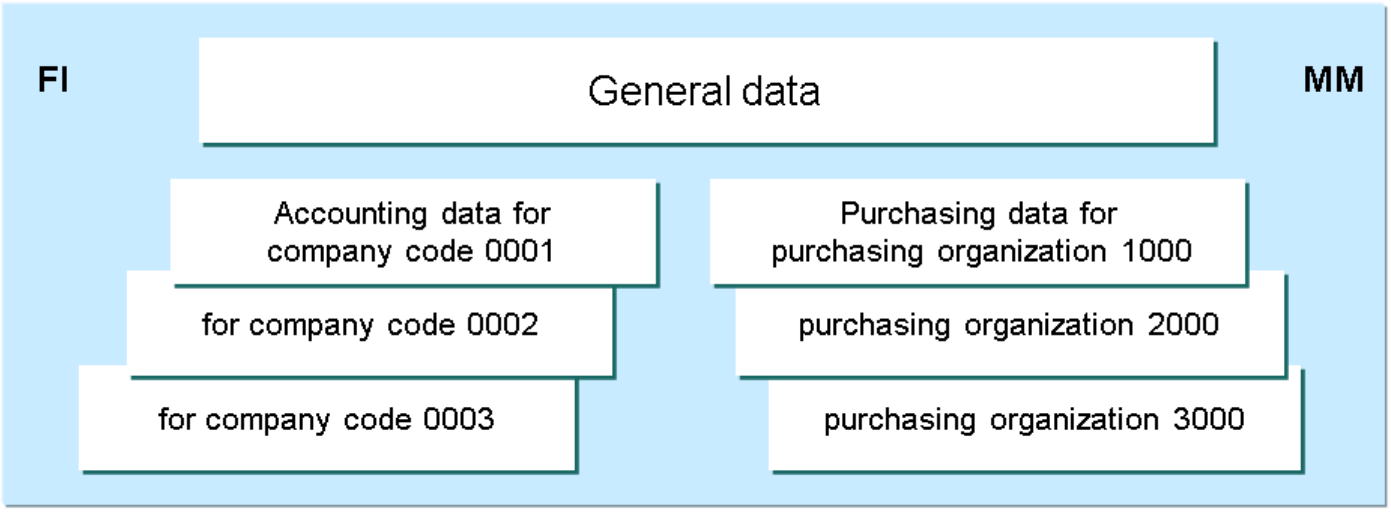

A supplier/vendor master record contains:

- Supplier/Vendor's name, address, language, and phone numbers
- Tax numbers
- Bank details
- Account control data like the number of the G/L reconciliation account for the supplier/vendor account
- Payment methods and terms of payment set up with the supplier/vendor
- Purchasing data

If you implement **Materials Management(MM)**, you will need purchasing data. For more information on this, see the documentation for **Materials Management**.

How is the Data Organized?

Master records are divided into the following areas so that each company code and each purchasing organization can store its own information for doing business with suppliers/vendors.

1. General data
2. This is data that applies to every company code and every purchasing organization in your company. The general area includes, for example, the supplier/vendor's name, address, language, and telephone number.
3. Company code data
4. This is data that is specific to an individual company code. Company code data includes, for example, the reconciliation account number and payment terms.
5. Purchasing organization data

This is data relevant to the purchasing organization of your company. For example, requests for quotations, purchase orders, and invoice verifications are stored in this section. You need the **Materials Management (MM)** application component in order to enter this data and print purchase orders.

Example

Two company codes within an organization do business with the same supplier/vendor. The general data, such as the address, is stored in the general area. Both company codes use this data for communication with the supplier/vendor. Each company code maintains specific information for financial accounting (for example, the reconciliation account) and for their business transactions with the supplier/vendor (for example, payment terms) in their own company code area.

What is the Function of the Account Group?

Account groups determine:

- The type of number assignment.
- A number range for assigning account numbers.
- Which fields are displayed and whether their entry is optional or required (field status) when you enter or change supplier/vendor master data.
- Whether the account is for one-time suppliers/vendors.

To create a master record, you have to specify an account group. The account group cannot be changed after you create the master record. Your system administrator, however, can change the above-mentioned account group specifications. For more information on account group specifications, see the **Define account group with screen layout** activity in Customizing for **Accounts Receivable and Accounts Payable**. A change in the account group specifications may be necessary if you want to add fields to the master record that were previously hidden. For instance, if you implement **Materials Management** after implementing **Financial Accounting**, you will need to have additional fields displayed in the master record.

How are Master Records Numbered?

Each master record has a unique number. You need this number to display or change the master record and to post to the supplier/vendor account.

The supplier/vendor master record number can be assigned either internally or externally. Internal numbers are assigned by the system, whereas you enter external numbers yourself when you create the supplier/vendor master record. External numbers can be alphanumeric.

The account group determines whether account numbers are internal or external and what the valid number interval for a supplier/vendor master record is.

The system ensures that the numbers assigned are always unique. With internal assignment, the system selects the next number from the interval. With external assignment, the system prevents you from entering the same number twice.

ⓘ Note

A supplier/vendor account has the same number for all company codes. You can find more information about number ranges in the Implementation Guide for Financial Accounting.

Screen Layout for Supplier/Vendor Master Records

Depending on what type of data you keep about your suppliers/vendors, you can adapt the screens for entering and maintaining supplier/vendor master records to meet the requirements at your company.

There are four types of field status:

- Field is ready for input (optional field)
- Field must be filled (required field)
- Field is displayed only (display field)
- Field is hidden

The account group determines the status of the fields in a supplier/vendor master record. You have to specify an account group when creating a master record.

When you enter a supplier/vendor master record, you must makes an entry in some of the fields. These are indicated by a question mark (**?**). You can only continue onto the next entry screen after you have made an entry in these fields.

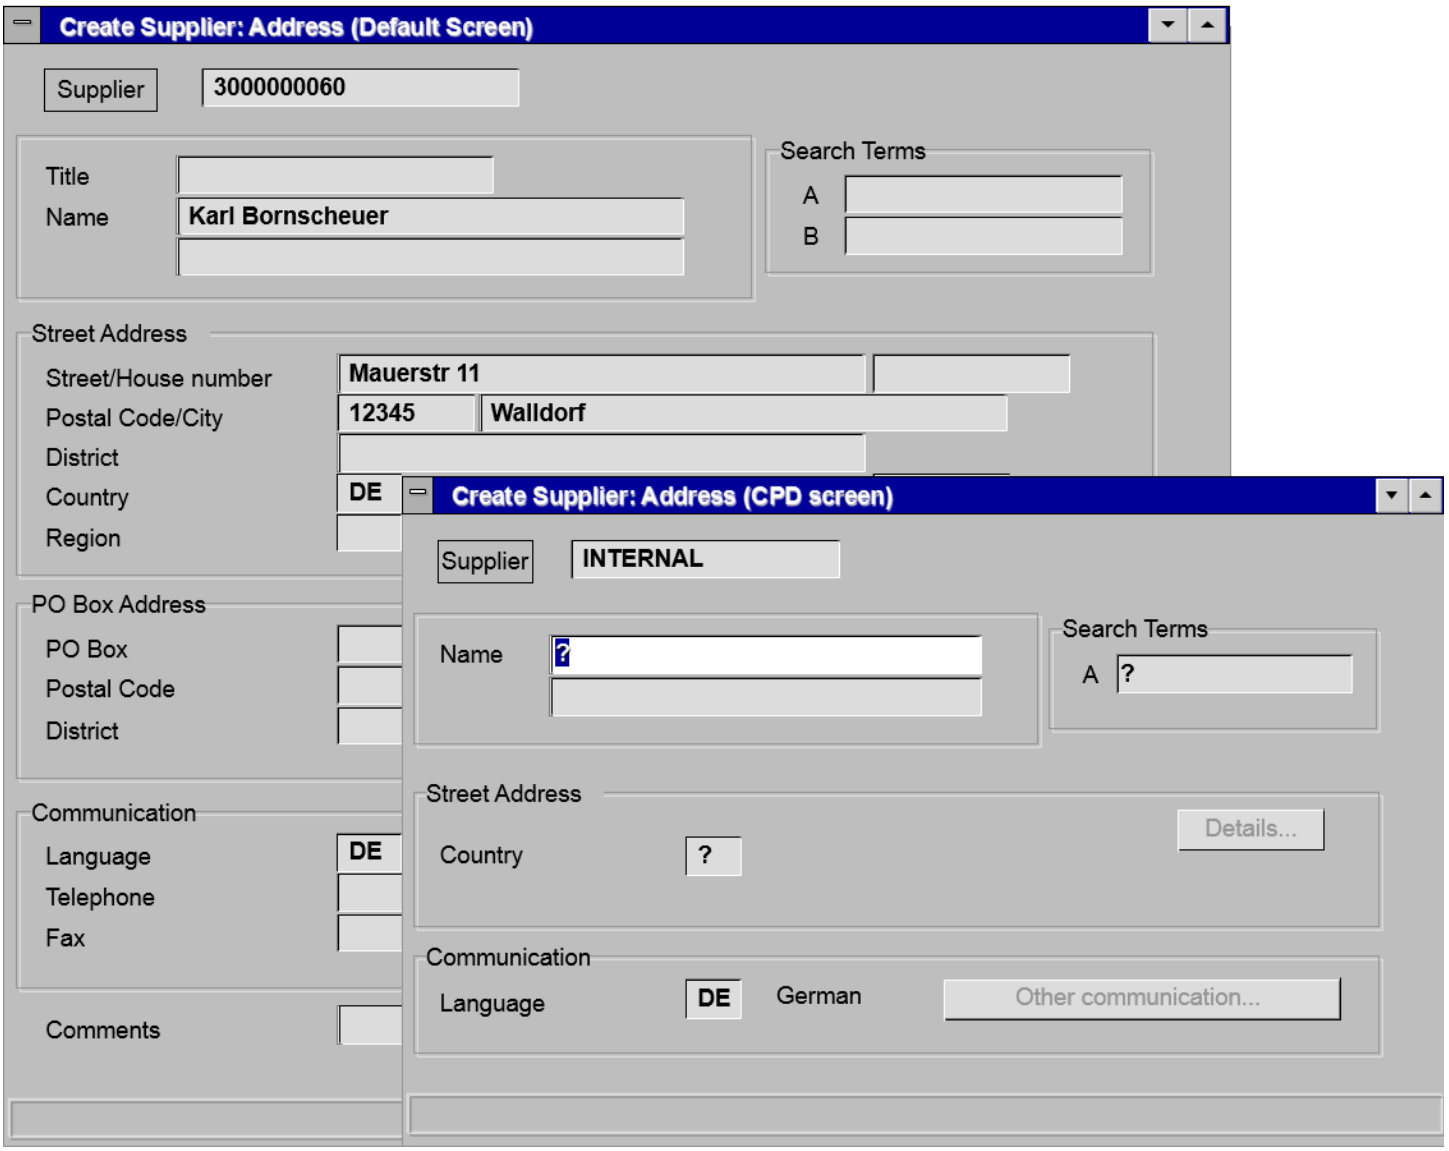

Field Status Definition: Supplier/Vendor Master Records

The Accounts Payable (FI-AP) application component is delivered with predefined screens on which to enter your master data. You can change the layout of these screens by defining the status of the fields in the account group. You can:

- Hide a field
- Make it a required entry (required field)
- Make it an optional entry (optional field)
- Set it for display only

Example

The screens for master records of one-time accounts should have a different layout to the ones for all other master records. Fields for address, communication, and bank data are not required in the master record for one-time accounts since you enter this information directly in the document. You should therefore hide these fields for one-time accounts. The following graphic shows one screen screen containing all fields, and another for one-time master records:

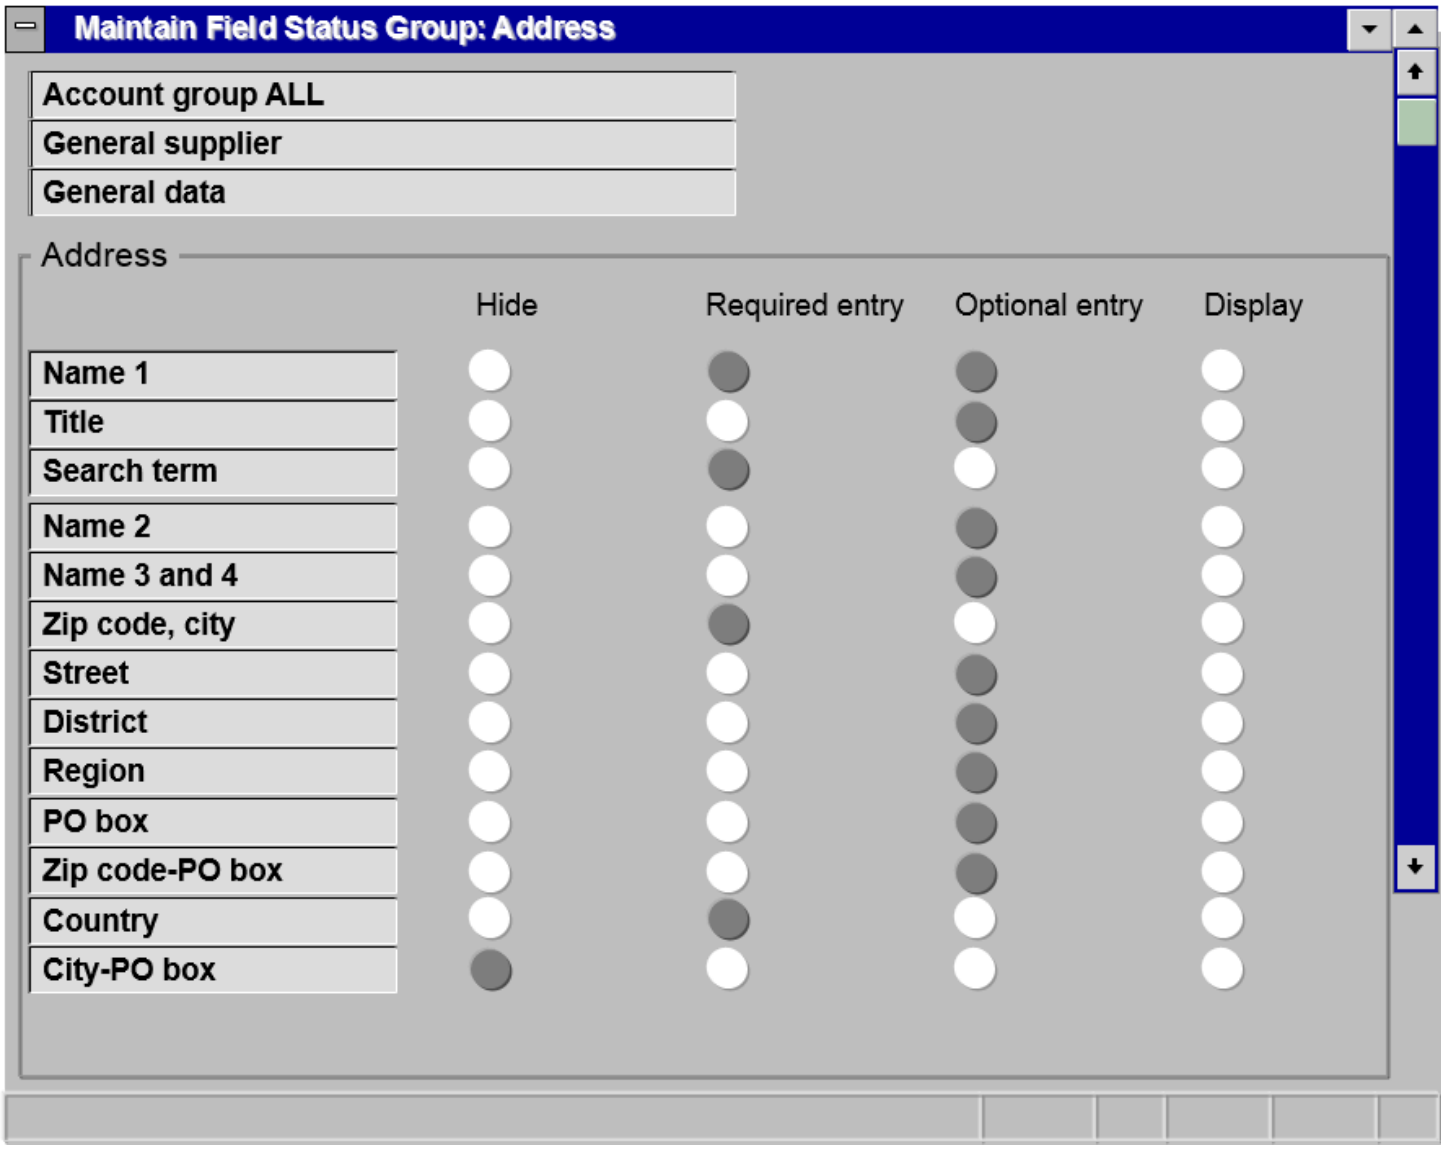

Some fields are grouped together so that you do not have to make a separate setting for each of them.

Example

Fields for interest calculation are grouped together. If you hide this field group, the fields for interest calculation frequency and the last key date are not displayed on the master record screen.

When defining or changing an account group, you specify the status of a field group by simply selecting the required status for the fields or field groups as shown in the illustration below:

The layout of screens can be affected by several field status definitions. Usually you define the status of a field based on the account group. You can, however, also define the status of a field based on the activity or company code.

Field Status Definition for Account Groups

You set up the status of screen fields when defining and maintaining account groups. You can use the account group to define the field status separately for the various areas of the master record. You can define the field status for:

- General data area
- Company code area. These settings affect all company codes.
- Purchasing area. These settings affect all purchasing organizations.

Example

In master records for one-time accounts, you want to hide the fields for address, communication, and bank data. You set the status of these fields in the general data area, because this is where the fields appear. You have to set the **Reconciliation account** field in these master records as a required entry field, since a reconciliation account must also be specified for one-time accounts. This field is dependent on the company code, and you specify its status in the company code data area.

Field Status Definition for Activities: Supplier/Vendor Master Records

The status of a field or field group can also be defined based on the following transactions or activities:

- Display
- Create
- Change

For each transaction, you can define the status of fields separately in the individual areas of a master record in the same manner as account groups:

- General data area
- Company code area. These settings affect all company codes.
- Purchasing area. These settings affect all purchasing organizations.

You can set the display status as well as the other field status settings.

Example

The reconciliation account field must be entered when creating a supplier/vendor master record. You therefore define this field as a required entry in the account group. The reconciliation account entry should not be changed once the master record is created. You therefore set the status of the field in the change transaction to display, so that it cannot be changed when users access the change function for master records.

Field status definitions for transactions are already set in the standard system. If you want to change the standard settings, SAP recommends the following:

- For the **Create** transaction, set the optional status for all fields.
- For the **Display** transaction, set the display status for all field groups unless you want to suppress a particular field group for all account groups.
- For the **Change** transaction, set the optional status for all field groups except those that you do not want users to change once they are specified. Set the status of these fields to either display or suppressed.

Field Status Definition for Company Codes: Supplier/Vendor Master Records

In addition to defining a field status for account groups and activities, you can define field status based on company codes if you want to set the status of fields in one company code differently from all other company codes. When defining the status of these fields, you have to enter the number of the company code in question.

Example

Suppose that for a given company code, you do not need the fields for export credit insurance in supplier/vendor master records. In this case, you would suppress these fields by defining their status dependent on that company code.

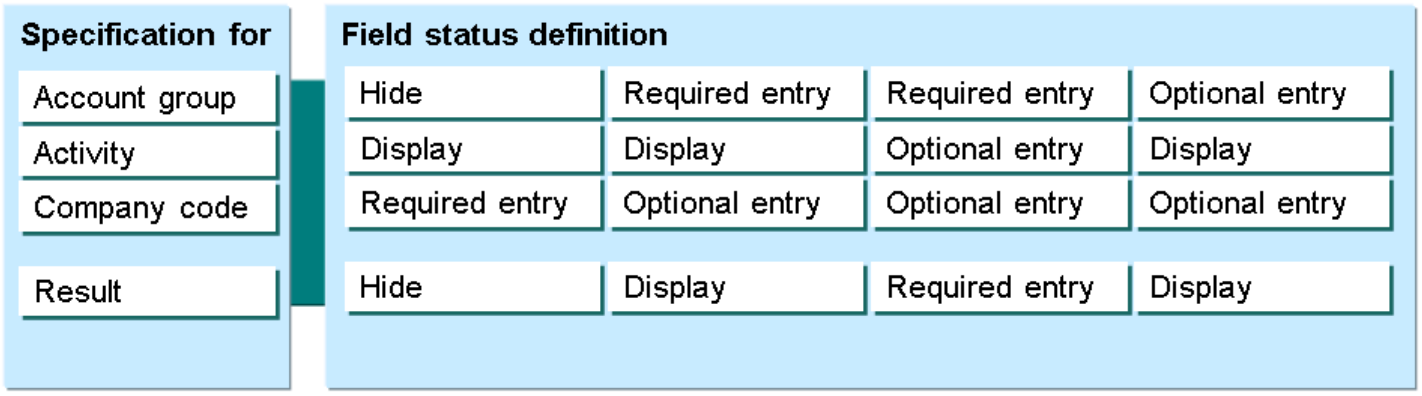

Note

In the standard system, the default field status is set for all company codes. If you do not change this setting, all field groups in the company code area of master records have the optional entry status.

Linking Field Status Definitions

When you create, display or change a master record, the settings you make for the various field status definitions are linked with each other. This means that the fields in a field group adopt the status that has the highest priority.

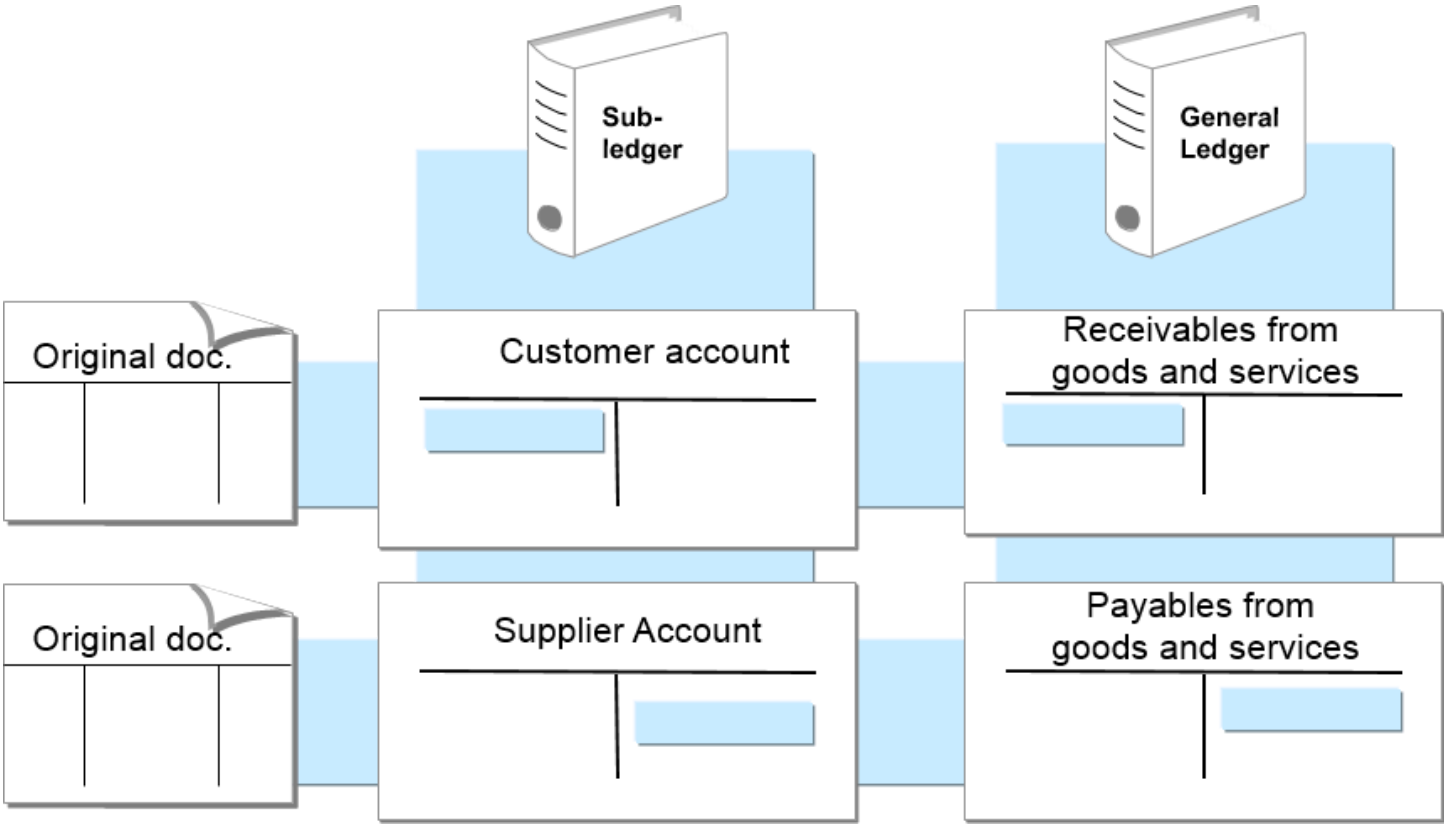

Hidden status has the highest priority, followed by display, required, and optional status. The table below contains different field status definitions and shows what the actual status would be once they are combined.

Specification for	Field status definition			
Account group	Hide	Required entry	Required entry	Optional entry
Activity	Display	Display	Optional entry	Display
Company code	Required entry	Optional entry	Optional entry	Optional entry
Result	Hide	Display	Required entry	Display

Functions of the Reconciliation Account: Supplier/Vendor Master Records

When you post items to a subsidiary ledger, the system automatically posts the same data to the general ledger (see the following illustration). Each subsidiary ledger has one or more reconciliation accounts in the general ledger. These reconciliation accounts ensure that the balance of G/L accounts is always zero. This means that you can draw up balance sheets at any time without having to transfer totals from the subledgers to the general ledger.

You have to specify a reconciliation account in every supplier/vendor master record. Settings made in a reconciliation account also affect the supplier/vendor accounts:

- You can use the reconciliation account to configure the screens for posting items to supplier/vendor accounts. Using the reconciliation account you could, for example, hide the fields for exchange rate hedges if these types of transaction are not made. For more information, see the documentation on **Document Posting**.
- You can also use the reconciliation account to specify which currencies you can use in posting to the corresponding supplier/vendor accounts.

For more information on reconciliation accounts, see the documentation on **General Topics in Financial Accounting**.

Access Authorization

You can restrict access to master records in order to prevent unauthorized changes. Depending on how you organize your master data, you can assign authorizations for maintaining this data. For example, one user may have authorization to maintain all master data, while another may have authorization to maintain only accounting master data.

You can even assign authorizations for different types of processing. All users could have authorization to display master records while only a limited group of users may be able to create and change master data.

Authorizations are specified during system configuration and assigned to each user in her user master record. The Implementation Guide for Financial Accounting explains how to set up authorizations.

Special Fields in Supplier/Vendor Master Records

The following fields in supplier/vendor master records have special functions:

- Search Term: Supplier/Vendor Master Records

- Alternative Payee
- Affiliated Companies: Supplier/Vendor Master Records
- Clearing Between a Customer and Supplier/Vendor
- Group: Supplier/Vendor Master Records
- Accounting Clerk: Supplier/Vendor Master Records

Search Term: Supplier/Vendor Master Data

If you do not know a supplier/vendor account number, you can search for the supplier/vendor master record using certain fields in the master record. In most cases, you will want to search for an account using the supplier/vendor's name. For this SAP uses the **Search Term** field, which is independent of the address fields. A search term is required since the name for search functions is formulated differently from how it is formulated in the address.

Your company should have rules on how to enter this field so that consistency is maintained. The search term usually consists of only the most important parts of a supplier/vendor's name. Before you make any entry in this field in the master record, find out how your company wants this field filled. The system does not distinguish between upper and lower case letters.

Example

The name of the supplier/vendor's company is **Dr. Dwight Evans & Sons, Limited.** You enter the full name of the company in one of the **Name** fields for the address format. To keep the search terms consistent, your company has decided that supplementary name data (such as "Dr" and "& Son") is not to be entered in the **Search term** field. Therefore, all your accounting personnel know that supplementary name data is not required for a search and accordingly enter only the name **EVANS** in the **Search Term** field.

Alternative Payee

The payment program can make payment to a supplier/vendor other than the one to which the invoice was posted. Payment is made to an alternative payee, which must be specified in the master record.

You can specify an alternative payee in the general data area and in the company code data area. The alternative payee specified in the general data area is used by every company code. If you specify an alternative payee in both areas, the specification in the company code area has priority.

To always make vender payments to an alternative payee, proceed as follows:

1. Create a supplier/vendor master record for the alternative payee. Block this account against posting.
2. Specify the account number of the alternative payee in the **Alternative payee** field within the payment transactions section of the supplier/vendor master record.

When making payments for this supplier/vendor, the payment program will always access the name and address of the alternative payee.

In some instances it may be better to specify a payee in the document. To do this, you have to activate this function by selecting the **Payee in document** indicator in the general data area. When you enter documents for this account, the system displays a field in which you can enter an alternative payee.

The system always uses the payee which is most specific. This means that when you enter a payee in a document, it has priority over payees specified in the master record.

Affiliated Companies: Supplier/Vendor Master Records

If invoices are sent to companies which are members of your consolidation group, you have to include these companies in consolidation. All sales revenues originating from business transactions within the corporate group have to be eliminated (elimination of intercompany revenue and expense). To enable the system to eliminate these revenues, you need to specify a standard, corporate-wide company ID in the **Trading partner** field in every supplier/vendor master record set up for an affiliated company. The consolidation system uses this number to identify intercompany revenues and expenses for consolidation purposes.

Clearing Between a Customer and Supplier/Vendor

If a supplier/vendor is also a customer, or vice versa, you can have the payment program and the dunning program clear the supplier/vendor and customer open items against each other. You can also select the customer line items when you display the supplier/vendor line items for this account.

Before you can clear items between a supplier/vendor and customer account, you must:

1. Create a customer master record for the supplier/vendor who is also a customer.
2. Enter the customer account number in the **Customer** field in the control section of the general data in the supplier/vendor master record.
3. Enter the supplier/vendor account number in the **Vendor** field in the control section of the general data in the customer master record.
4. Select **Clrg with vend.** and **Clrg with cust.** in the company data in both the customer and supplier/vendor master records. In this way, each company code can decide separately whether it wants to clear the customer with the supplier/vendor.

Group: Supplier/Vendor Master Records

If several suppliers/vendors belong to a group, you can define this information in the master record. To do so, enter a user-defined key in the **Group** field in the general data section of the record. You can use this key when running evaluations, or use the field as a matchcode.

Assigning Master Records to Accounting Clerks

Use

You wish to assign a specific accounting clerk to customers or suppliers/vendors for processing their master data.

Prerequisites

You can assign every user an ID based on the company code in Customizing.

Features

In Customizing, you enter the accounting clerk's name under the ID. The clerk enters the ID in the customer and supplier/vendor master records for which he or she is responsible. The accounting clerk's name is then printed in any correspondence with the customers or suppliers/vendors. Dunning lists and payment proposal lists are sorted by clerk.

Activities

Enter the accounting clerk's ID in the master record.

Functions for Maintaining Supplier/Vendor Master Data

The following functions are available for processing supplier/vendor master records:

- Create
- Change
- Display
- Block/unblock
- Mark for deletion/remove mark

If your company also has the **Materials Management (MM)** application component, you can create and maintain supplier/vendor master records either together or separately as follows:

- Separately for the company code
- Separately for the purchasing area
- Centrally for both the company code and purchasing area at the same time

To enter data in the purchasing area, you need the **Materials Management (MM)** application component. There are three different ways to process master records since they are often created and maintained by different departments. In some companies, accounting and purchasing personnel maintain the general area together and their own areas separately. In other companies, supplier/vendor master records are maintained centrally.

Depending on how your company organizes its supplier/vendor information, authorizations will be assigned for creating and maintaining supplier/vendor records. This means that not every user may be able to use every function.

Selecting Screens to Display Supplier/Vendor Master Data

Additional Functions for Maintaining Supplier/Vendor Master Data

Selecting Screens to Display Supplier/Vendor Master Data

You can select certain individual screens when you want to display or change information in the supplier/vendor master record (**screen selection**). Instead of having to go through every screen, you go directly to the necessary screen.

Example

You want to display data for payment transactions. To do this, you select the payment transaction screens on the initial screen. You then go directly to the corresponding screens.

Additional Functions for Maintaining Supplier/Vendor Master Data

The following functions are available for maintaining supplier/vendor master data:

- **Change the editing function**

Under the Vendor menu, you can branch from the display function to the change function. You can also retrieve another master record to change or display. You can exit the function at any time.

- **Save the master record**

You can save the supplier/vendor master record in any screen and return to the initial screen. When you create a master record, the system ensures that you fill out all the required fields. Choose Vendor > Save from the menu bar.

- **Dual control for changes to the master record**

You can protect important fields in your supplier/vendor master records against incorrect or unauthorized changes. When a "sensitive" field is changed, the supplier account remains blocked for the payment run until the field changes have been confirmed by a second authorized person.

The second authorized person confirms the changes to the master record under Confirmation of change in the main menu for supplier/vendor master records.

- **Go to another screen**

The data in a supplier master record spans several screens. When displaying or changing a supplier master record, you can branch between screens by choosing Goto and then the required screen.

- **Administrative data, blocking data, and deletion flags**

Under the menu bar option Extras, you can choose the following functions:

- Administrative data shows you who created the master record and when.
- Blocking data shows you whether the account is blocked.
- Deletion flags show you whether the master record is marked for deletion.
- In the Blocking data and Deletion flags functions, you can also set and remove the flags for blocking or deleting the master record. To do this, however, you have to be in the change function.

- **Texts**

You can use the Texts function to enter texts about the supplier/vendor. This function is found under Extras.

- **Documents**

You can use the Documents function to allocate documents that were scanned into the system (business reports or newspaper articles) to a supplier/vendor. This function is found under Extras.

- **Address versions**

You can use this function to manage addresses in several scripts. This function is used in Japan, for example. The address versions are not, however, read by the system when it is configured to the standard settings.

- **Purchasing data**

By choosing Goto > Purchasing data, you can display the supplier/vendor's purchasing data and partner functions.

- **Field and account changes**

You can use the functions **Field changes** and **Account changes** to display changes to a certain field or to the entire supplier/vendor master record. Choose these functions via the menu bar option **Environment**.

- **Reference account**

You can use the **Reference account** function to display the master record of an account specified as a reference in the supplier/vendor master record. If your supplier/vendor is also a customer, for example, you can switch to the customer master record. If you keep head office and branch accounts, you can also display the master record of the head office. Choose this function from the menu bar option **Environment**.

- **Bank details**

When you enter, change, or display bank details in a supplier/vendor master record, you can display the master data of the banks specified in the master record. Choose this function from the menu bar option **Environment**.

Creating Supplier/Vendor Master Records: Overview

Before you create a supplier/vendor master record, you have to make and check some system settings.

Supplier/Vendor master records are used by both the Accounting component and the Purchasing component. Before you create a supplier/vendor master record in Accounting, you need to make sure that the master record is not already created in Purchasing. You can use the search help to do this. For more information, see the **Getting Started** document. You can also use the automatic duplication check to ensure that users that you configure in Customizing.

The following topics explain how to create a supplier/vendor master record centrally for both Accounting and Purchasing and how to create a master record for just Accounting. Creating a supplier/vendor master record centrally involves entering data for both Accounting and Purchasing in one step. This method is possible only if you have installed and configured the **Materials Management (MM)** application. For more details, see the relevant documentation.

To enter master data for the accounting department only, use the appropriate functions in Accounting.

Creating Supplier/Vendor Master Records Centrally

Creating Supplier/Vendor Master Records for a Company Code

Special Features in Data Entry

Head Office and Branch Accounts

Creating a Supplier/Vendor Master Record Using a Reference

You can create a master record by referencing an existing one, in which case the system copies certain data from the reference master record. However, the system does not transfer all data; which data is transferred depends on several factors:

- The system only transfers data that is not supplier/vendor-specific. For example, the address or a block indicator is not transferred from the reference master record.
- The transfer of data depends on the data you have already entered for your supplier/vendor. In general, if you have already maintained data, the data is not overwritten with data from the reference record.
- For example, if you have already created the general data, such as the name, address, and phone number, only the company code data is transferred when you enter the company code data. To transfer the company code data only, you must specify the company code of the reference master record. When you create the data for the purchasing department, again only the corresponding data is transferred from the reference master record.
- If you have not yet created the general data, only the language and the country are transferred from the reference master record.
- You determine which data is transferred by specifying which areas are to be transferred from the reference master record. If you do not specify a purchasing organization for the reference, for example, the purchasing data is not transferred.

ℹ Note

When you create a new supplier/vendor master record in this way, you can choose whether you want to use the account group of the reference master record. In this case, do not enter an account group for the master record to be created. The system automatically transfers the account group from the reference master record.

You can use a supplier/vendor master record from any company code as a reference. The data from the reference is used merely for default values. You should check each screen before saving and, if necessary, add data or change the default data.

Creating a Supplier/Vendor Master Record Centrally

If you have purchased, installed, and configured **MM Materials Management**, you can create a supplier master record centrally as follows:

1. From the **Accounts Payable** menu, choose **Master records** > **Maintain centrally** > **Create** > .
2. The initial screen for creating the supplier/vendor appears.
3. If you use **external number assignment**, enter the supplier/vendor's account number.
4. If you use **internal number assignment**, the system assigns a number when you save the supplier/vendor master record. Until then, the word "INTERNAL" appears on the screen in place of the account number.
5. Enter a company code and a purchasing department, depending on the data areas you want to maintain.
6. You can only enter data in a company code or a purchasing department, if you specify one or the other. Otherwise, you can only enter the general data of the supplier/vendor master record.
7. Enter an account group and select ENTER.

8. The first screen for entering supplier/vendor master data appears.

> **Note**
>
> When you create a supplier/vendor master record for which the general data has already been created, the first screen for the company code or purchasing department data appears.

9. Enter the supplier data and select ENTER to reach the next entry screen.
10. In each screen the system displays, in the upper left-hand corner, which data area you are entering data for. When you enter company code or purchasing data, the company code or the purchasing organization is displayed. If neither of these is displayed, you are in the general area.
11. In the last screen, save your master data by choosing Vendor > Save.

The system displays the initial screen again, with a message confirming that the data is saved.

Creating a Supplier/Vendor Master Record for a Company Code

Create a master record for accounting only as follows:

1. From the Accounts Payable menu, choose Master records > Create.
2. The initial screen for creating the supplier/vendor appears.
3. If you use **external number assignment**, enter the supplier/vendor's account number.
4. If you use **internal number assignment**, the system assigns a number when you save the master data.
5. Enter the company code and the account group and select ENTER.
6. The first screen for entering master data appears.
7. Enter your supplier/vendor data and then select ENTER to reach the next entry screen.
8. Save your master data by choosing Vendor > Save.

The system displays the initial screen again and a message that confirms that the data is saved.

> **Note**
>
> If you have created master records in one company code and require exactly the same master records in another company code, you can distribute the newly created master records to other company codes via the following menu path in the Financial Accounting Configuration screen: Tools > Data distribution > Accounts payable > Send.

For more information on this topic, consult the Implementation Guide.

Special Features in Data Entry

When you create a supplier/vendor master record, you must enter certain data in special entry screens. This is data you need to enter in exceptional cases only. This data includes:

- Bank data, in cases where there is no bank master data yet
- Dunning procedures

- Texts
- Documents

The system also offers a special selection function for entering payment methods. This function is described below.

See also:

Entering Bank Details

Entering a Payment Method

Entering a Dunning Procedure

Entering Text

Assigning Documents

Classifying Suppliers/Vendors

Entering Bank Details

For each supplier/vendor, you can specify as many banks as you require. To pay a supplier/vendor by bank transfer using the payment program, you must enter the supplier/vendor's bank country, bank key, and bank account number) in the supplier/vendor master record. For control purposes, the system then displays the bank name data.

When you enter your supplier/vendor's bank address, the system checks whether master data already exists for this bank. If not, the system goes to the maintenance screen for bank master data. You maintain your supplier/vendor's postal giro accounts in exactly the same way as other bank accounts.

Whilst maintaining supplier/vendor master records, you can enter bank address details by carrying out the following steps:

1. In the screen for payment transactions, enter the bank country, the bank key, the bank account number, and a control key (required in France).
2. If appropriate, you can indicate whether direct debiting is allowed for this account. You can also enter a unique bank key of your choice for the payment program in the field **BnkType**. With the help of this bank ID, you can specify in the document line item which of the business partner's banks is to be used.
3. Press ENTER.
4. If there is no master data for the specified bank yet, the system displays a pop-up window where you can add bank master data.
    a. Enter the master data for the bank.
    b. Select ENTER to return to the entry screen for supplier/vendor master records.

The bank data is saved when you save a supplier/vendor master record.

To change or add to bank master data, place the cursor on the required bank and choose **Environment** > **Bank data**. The system displays a window for entering and maintaining master data.

Entering a Payment Method

You can enter payment methods in the payment transactions screen for company code data. Each payment method is represented by a single letter or number.

If you already know the characters for payment methods, enter one or more in the field **Payment methods**.

If you do not know the characters, choose the **possible entries** button (F4) in order to display the values you can enter. Select the payment methods you require from this list.

The system transfers the selected payment methods to the field **Payment methods**. You can overwrite these specifications.

ℹ Note

If you enter a specific payment method in the item to be paid, then this specification has priority over the entry which has been made in the master record. You may also enter payment methods which are not listed in the master record in the item.

Entering a Dunning Procedure

You can enter a dunning procedure for your supplier/vendor in the screen for correspondence. This dunning procedure is used for the standard dunning area. If you use other dunning areas in your company, you must enter them in a separate entry screen. To do this, proceed as follows:

1. Enter the key for your standard procedure in the company code data in the field **Dunning procedure** in the **Create vendor: Accounting Correspondence** screen. If you do not have dunning areas, skip steps 2 and 3.
2. To define dunning procedures for other dunning areas, choose **Details** > **Dunning areas**.
3. The screen for maintaining dunning areas appears.
4. Enter the data for your dunning areas.
5. This data includes the dunning area and the dunning procedure. You can also enter a dunning block for the dunning area or an alternative dunning recipient, if the dunning letter is not to be sent to the supplier/vendor from whom the receivable is due.
6. Choose **Goto** > **Back**.

You return to the screen **Create Vendor: Correspondence Bookkeeping**. The system saves your entries when you save the supplier/vendor master data.

Entering Text

For each supplier/vendor, you can enter explanatory texts. You enter central information under general data, and accounting-specific texts, such as "information on withholding tax", on company code level.

The text types which are relevant will be specified during system setting. For each text type, you can create a new text in a different language.

Enter text about the supplier/vendor as follows:

1. From the menu bar while entering a supplier/vendor master record, choose **Details** > **Texts**.
2. A window appears, in which you can enter text.
3. Select one of the suggested text types and enter text in the column **Line 1**.

4. To enter the text in a language other than your logon language, specify the key for the other language in the column Lng.

   The symbol * in front of a line signifies that the text has already been edited.

   When this symbol is at the end of a line, it means that there is more text for this text type than can fit into a single line.

   In order to add text in a different language to a particular text type, place the cursor on the relevant text type and choose Edit > Create text. Then you can enter the language key and the text for it.

5. Choose Edit > Detail text to call up the text editor. The editor allows you to enter any length of text.

6. Before quitting the text editor, choose Text > Save.

7. Choose Goto > Back.

8. The initial screen for text entry appears. The first line of your text is displayed.

9. Choose Goto > Back once more in order to quit the window for text entry.

You return to the screen at which you started. The system stores your entries when you save the supplier/vendor's master data.

Assigning Documents

You have the possibility of allocating documents scanned-in such as annual reports, newspaper articles or graphics to each creditor. In order to be able to use the document management system (DMS), however, you must be using SAP ArchiveLink.

To assign a document to a customer, proceed as follows:

1. When entering or changing a customer master record, choose Extras Documents Extras > Documents.

   The Customer-Link to Documents dialog box appears.

2. Here you enter a document type and name. If you do not know the name, you can display a list of all the documents in the system using the function Find document. Select the document you require. The document is assigned to the customer and then displayed on the Customer-Link to Documents screen.

3. You can use the Display originals function to display a document that you selected for a customer.

For information about the features of document management system (DMS), see the SAP library under Cross-Application Components > Document Management System.

Classify Supplier/Vendor

You can classify your supplier/vendors using Environment > Classification when maintaining your master data. These classes might be defined in the system settings.

In financial accounting, you can group together or rather classify your suppliers/vendors in to groups according to branches or sales figures.

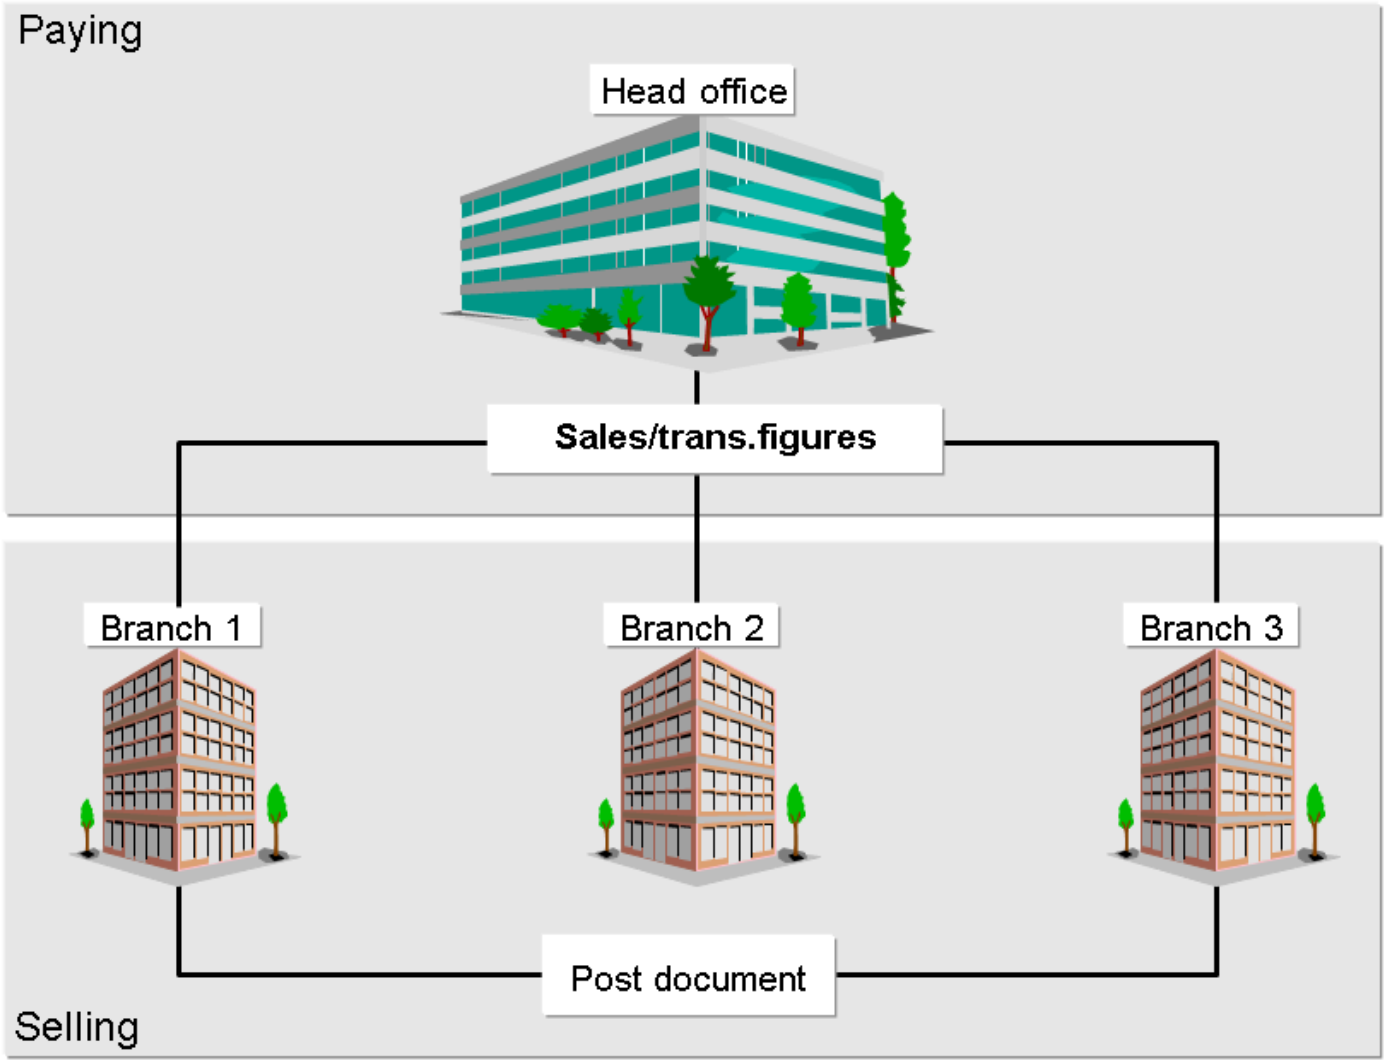

For more information on classification, see the SAP library under Cross Application Components > Class System.

Head Office and Branch Accounts

In some industries, branches of a company sell their goods independently but the accounting for these sales is performed centrally (at the head office). You can represent this type of organizational structure in the system by using head office and branch

accounts.

First you need to create head office and branch accounts. The sales orders are managed in the branch account. The sales and transaction figures, however, are not posted to this account but rather automatically to the head office account. Payments are cleared centrally by the head office, meaning that outgoing payments can be made for several branches in one step, using the head office account.

Link between Branch Accounts and Head Office Account

To link branch accounts to a head office account, you must enter the number of the head office account in the **Head office** field in the branch account master record. This field is contained in the company code area of the master record.

The head office account can be any supplier/vendor account except one-time accounts or branch accounts themselves. Branch accounts and head office accounts must belong to the same company code.

Line Item Display

For head office accounts, enter the key 004 in the field **Sort Key**. This instructs the system to display the line items for the head office account sorted by branch. This key is defined in the table for allocation rules.

For more information on line item display and the **Sort Key** field, see Sorting Line Items .

Correspondence

You can set up your system to cater for written correspondence with suppliers/vendors a) for the head office, broken down per branch or b) for each branch individually. If you want to create correspondence (such as dunning notices and account statements) for the individual branches instead of the head office, you have to select the **Local processing** field in the supplier/vendor master record of the head office on the **Create Customer: Accounting Correspondence** screen.

You can also define payment methods in the master records of the branches and head offices. For example, if you want to have certain payment methods for particular branches, enter these in the master records of the branches concerned and do not enter any payment method in the head office master record. If you enter payment methods in both head office and branch master records, all payment methods are possible.

Creating One-Time Accounts

For suppliers/vendors with whom you do business only once or rarely, you should create one and only one supplier/vendor master record. This "one-time account" makes it possible to enter the supplier/vendor name, address, phone number, and bank address data when you enter the invoice. This conserves space on the disk drive, since you do not enter an entire supplier/vendor master record for each supplier/vendor from whom you make only one purchase.

Example

You purchase from a supplier/vendor, because your main supplier/vendor could not supply you. In this case, you post the invoice to a one-time supplier/vendor account. You do not create a separate master record for this supplier/vendor.

In contrast to other supplier/vendor master records, a one-time supplier/vendor master record is used for several suppliers/vendors, so that you do not have to create a large number of supplier/vendor master records that are used only once. As a result, you do not store any supplier/vendor-specific data in the supplier/vendor master record for one-time accounts. When you post to a one-time account, the system automatically goes to a master data screen. In this screen, you enter the specific master data for the supplier/vendor, which is stored separately in the document. This includes name, address and bank address data, for example.

You create, display, block, and delete one-time supplier/vendor master records in the same way as all other supplier/vendor master records. You can find more information in the appropriate topics of this section. The next sub-topics describe the special features of one-time accounts only.

Account Group

Each supplier/vendor master record for one-time accounts must have its own account group. Via this account group, the supplier/vendor-specific fields, such as **name**, **address**, and **bank address data**, are suppressed from display when you enter the supplier/vendor master record. You enter this data when you enter the document.

Reference Account Group

You can specify a reference account group in the **Control** group in the general data area. This account group determines the status of fields when posting to the one-time account, that is, what fields are displayed and which ones require an entry. The fields are controlled in the same manner when displaying or changing a one-time document, although the document change rules also determine whether a field is changeable or not.

If you do not specify a reference account group, every field on the one-time account screen is ready for input during document entry.

You can use an existing account group as your reference account group or you can create an account group specially for this purpose. For more information on this, see the **Define account groups with screen layout (vendors)** activity in Customizing for **Accounts Receivable and Accounts Payable**.

Reconciliation Accounts

To create one-time master records, you have to specify a reconciliation account. If you differentiate between reconciliation accounts in your company, you will need to take this into account when creating one-time master records. Your company may have different reconciliation accounts for domestic and foreign payables. You would then have to create two one-time master records for these accounts.

Line Item Display

You post line items to a specific supplier/vendor account. Later, you can display the line items in the line item display screen. The **Sort key** field in the supplier/vendor master record determines how the displayed line items are sorted. If you enter a search term in the supplier/vendor master record, the system makes an entry in the **Allocation** field on the basis of the sort key you specified, when you post line items to the supplier/vendor account. When you display line items in the account, the system sorts the line items according to the **Allocation** field. You can change the sort sequence while you display line items.

For line item display, you should enter a key for sorting line items in the **Sort key** field. Keys 022 and 023 are provided in the standard system with the following meanings:

- Enter **022** to have the system sort and display line items according to supplier/vendor name and city.
- Enter **023** to have the system sort and display line items according to city and supplier/vendor name.

Sort criteria can also be specified when entering a document. These criteria will override the sort keys specified in the master record.

Displaying a Supplier/Vendor Master Record

Both the accounting and purchasing departments can have access to a supplier/vendor master record. You can display either the general and company code data (the accounting data) or the entire supplier/vendor master record (with purchasing data). Personnel in the purchasing department can display the data about purchasing, invoice verification, and inventory control for a supplier/vendor.

This topic describes how you display a vendor master record either centrally or for accounting. You can find further information on the purchasing functions in the **MM Materials Management** documentation.

Display a Supplier/Vendor Master Record Centrally

If you have purchased, installed, and configured the **MM Materials Management** application component, you can display a master record centrally as follows:

1. From the **Accounts Payable** menu, choose **Master records** > **Maintain centrally** > **Display**.
2. The system displays the initial screen for displaying master data, **Display Vendor: Initial screen**.
3. Enter the account number, the company code and the purchasing organization.
4. Depending on the data you want to display, you can omit the company code or the purchasing organization.

   A supplier/vendor master record spans several screens. If you want to see particular data only, you can select the screens you want to see in the initial screen. The system then shows you the corresponding screens only.
5. Select the screens you wish to display.
6. Select ENTER.
7. The supplier/vendor master record is displayed.

8. To leave the display, choose Vendor > Exit.

You return to the area menu.

Display a Supplier/Vendor Master Record for Accounting

If you want to display only that vendor master data required by the accounting department, proceed as follows:

1. Choose Master records > Display.
2. The system displays the initial screen for entering a supplier/vendor master record.
3. Enter the supplier/vendor account number and the company code.
4. A supplier/vendor master record spans several screens. To display particular data only, select the screens in the initial screen. The system then displays the corresponding screens only.
5. Select one or more screens to display by clicking in the field before the name of the screen.
6. Select ENTER to reach the next screen.
7. The system displays the next screen that you have selected in the supplier/vendor master record.
8. To leave the display, choose Vendor > Exit.

This returns you to the Accounts Payable menu.

Changing a Supplier/Vendor Master Record

With the exception of a few fields, you can change all the data of a supplier/vendor master record. The restrictions that are to be noted during a change can be found in the following SAP Note about 'changes'. The modification of a master record can be linked to authorizations. Therefore, not all fields are able to be changed. Ask your system administrator if you need further information about authorization.

As already explained in the display, the master data is displayed in several screen layouts. To serve this purpose, the system offers various functions. You can:

- Change data centrally (general, company code, and sales data)
- Change accounting data (general and company code data).
- Change sales data (general and company code data).

Which functions you can use depend on your authorizations. The first two change functions are described as follows. For more information about the sales functions, see the documentation for this application component.

The supplier/vendor master data are contained in several screens. Generally, you would want to change special data, therefore you can check the screens directly in the initial screen on which you want to make changes.

The system logs all changes. For each field, it stores the time of change, the name of the user, the current and the previous field contents. You can display the changes made to the entire supplier/vendor master record or to a specific field. For more information, see Displaying Changes to Supplier/Vendor Master Records.

Notes about Making Changes

You can no longer change the account number and account group after a customer master record has been created. All other fields are changeable. Your system administrator can use field status specifications or authorizations to restrict some fields from being changed. These fields are then just displayed. This is recommended for the reconciliation accounts, for example, so that they cannot be changed by mistake.

When changing master data, you should note the following:

- If you change the sort key for line item display, all line items posted after the change are sorted according to the new sort key.
- If you change the date of the last dunning run or the last interest calculation, this change will affect the next interest calculation or dunning run for the account. The frequency of the interest calculation or dunning is therefore changed. After the change, the calculated interest of the account or dunning may occur earlier.
- The reconciliation account number is contained in the supplier/vendor master record. If you change this account number after you have posted it to the supplier/vendor account, it is necessary to adjust the payables account for the preparation of the balance sheet at the end of the fiscal year. You make this adjustment by running the balance sheet adjustment program.
- You can specify whether the payment behavior should be recorded in the supplier/vendor account master record. If you decide to set this option later, you have to note that not all payment transactions are taken into account during the evaluation.

Centrally Change the Customer Master Record

Change Customer Master Record

Displaying Changes to Customer Master Records

Synchronization of Customer and Supplier/Vendor Master Data (FI)

Use

For general information about using master data synchronization, see

Master Data Synchronization

Customer/Vendor Integration

You can synchronize data for individual customers and suppliers/vendors or perform mass processing such as an initial data load. If the system cannot process a data record, it stops processing and issues a message. During mass processing, the system bundles the master data in packages of 100.

ℹ Note

For information on the initial data load, see Synchronization Cockpit.

For more information about supported database tables of the customers and suppliers/vendors, see the fixed values of the domains CMD_TABNAME and VMD_TABNAME.

For more information on activating/deactivating synchronization processes, see the Implementation Guide (IMG) for **Cross-Application Components** under **Master Data Synchronization** > **Synchronization Control** >.

Prerequisites

- You have authorization to edit customer or supplier/vendor master data.
- You have configured the mapping to perform the following functions:
  - Initial data load
  - Create customer or supplier/vendor and business partner simultaneously
- You have made the necessary settings in Customizing for Master Data Synchronization.

Features

You have the following options:

- Initial data load of customer or supplier/vendor master data
- Create customer or supplier/vendor master data

  Note

  The system only synchronizes selected account groups with the business partner. For more information about selecting the account group and the number assignment, see Number Assignment for Processing Direction Customer and Supplier/Vendor to BP.

- Change customer or supplier/vendor master data
- Delete / Archive customer and supplier/vendor master data

  If you want to delete (archive) customer or supplier/vendor master data, this is not possible as long as the master data is still connected to the master data of the business partner. From the business partner point of view, the master data must be archived first including the link to the customer or supplier/vendor. Only then is it possible to activate the deletion of the customer or supplier/vendor master data and archive it.

  If you want to load your data again, you must first load the customer or supplier/vendor master data and then load the business partner data with the link. You can only create a synchronization if the customer or supplier/vendor is currently not linked with a business partner.
- Create customer or supplier/vendor contact person
- Change customer or supplier/vendor contact person
-

Number Assignment for Processing Direction Customer/Vendor to BP

The selected account groupof the customer/vendor master record determines the number assignmentof the business partner to be created.

If you create the customer/vendor and the business partner, the following combinations and necessary activities can result relating to the selected account group of the customer/vendor and the number assignment of the business partner:

Selected Account Group	Activity
You have selected an account group with internal number assignment to which a business partner groupingwith internal number assignment is assigned.	The system automatically generates the customer/vendor number and the business partner number.
You have selected an account group with internal number assignment to which a business partner grouping with external number assignment is assigned. The number equivalence has been activated.	The system specifies the automatically selected customer/vendor number as the business partner number for business partner processing.
You have selected an account group with external number assignment to which a business partner grouping with internal number assignment is assigned.	You manually enter the customer/vendor number to be used in customer/vendor processing. The system automatically generates the business partner number.
You have selected an account group with external number assignment to which a business partner grouping with external number assignment is assigned. The number equivalence has been activated.	You manually enter the customer/vendor number to be used in customer/vendor processing. The system automatically specifies the selected customer/vendor number as the business partner number for business partner processing.

ℹ Note

The necessary assignment of the account groups of the customer/vendor master record and the business partner grouping is defined in Customizing for master data synchronization in the following IMG activities:

- Define Number Assignment for Direction Customer to BP
- Define Number Assignment for Direction Vendor to BP

Changing a Supplier/Vendor Master Record Centrally

Change a master record centrally as follows:

1. From the Accounts Payable menu, choose Master records > Maintain centrally > Change.
2. The system displays the initial screen for changing master data.
3. Enter the supplier/vendor account number, the company code and the purchasing organization.
4. Select which screens of the supplier/vendor master record to display by clicking in the field next to the name of one or more screens.
5. Depending on the data that you want to change, you can omit the company code or the purchasing organization.

   Supplier/Vendor master records span several screens. Generally speaking, you will want to change only certain fields. You can select the screens to make changes directly on the initial screen.
6. Select ENTER to reach the next screen.
7. The system displays the supplier/vendor master record.
8. Change the required data by overwriting it or adding to it.
9. Save your changes by choosing Vendor > Save.

You return to the area menu. The system confirms that the data has been saved with a message.

Changing a Supplier/Vendor Master Record for Accounting

If you want to change only the accounting data in a supplier/vendor master record, proceed as follows:

1. Choose Master records > Change from the Accounts Payable menu.
2. You reach the initial screen for changing master data.
3. Enter the supplier/vendor account number and the company code.
4. Supplier/Vendor master records span several screens. Generally, you wish to change certain fields only. You can select the screens to make changes directly in the initial screen.
5. Select which screens of the supplier/vendor master record to display by clicking in the field before the name of one or more screens.
6. Choose ENTER.
7. The master data from the account is displayed.
8. Change the required data by overwriting it or adding to it.
9. Save your changes by choosing Vendor > Save.

You return to the area menu. The system generates a message, confirming that the data has been saved.

ℹ Note

If you have changed master records in one company code and want to make exactly the same changes in other company codes, you can distribute these changes to the required company codes using the Send function. To access this function, choose Master records > Compare > Company codes > Send from the Accounts Payable menu. For more information on this topic, refer to the Implementation Guide.

Displaying Changes to Supplier/Vendor Master Records

When you change a master record, the system logs these changes and generates change documents. For each field, it stores the time of change, the name of the user, and the previous field contents.

You can display all the changes for the following:

- A certain field
- A master record
- For several supplier/vendor master records

The following changes are displayed separately:

- Overwritten field contents
- Any bank details and/or dunning areas entered after the master record was created
- Any bank details and/or dunning areas that have been deleted

Using the change documents, you can see which changes were made when.

From the Accounts Payable menu, you can display changes to a supplier/vendor master record as follows:

1. Choose Master records > Maintain centrally > Display changes.
2. The system displays the initial screen for displaying changes.
3. Enter the supplier/vendor's account number and the company code and, optionally, a dunning area, a purchasing organization, a date after which the account was changed, or a user that made the changes.
4. You can limit the changes display by specifying a change date and a user name.
5. Choose ENTER.
6. The system displays a list of types of changed fields.
7. Select the changes you want to display:
8.
    - To display a field change, place the cursor on the required field and select it.
    - To display all changes, choose Goto > All changes.
    - To display the entered bank data or dunning areas, choose Goto > Entries.
    - To display deleted bank data or dunning areas, choose Goto > Deletions.
    - To display the change document, choose Goto > Change document.
9. Leave the display of changes by choosing Account changes > Exit.

Displaying Changes in Several Supplier/Vendor Master Records

You can use program RFKABL00 to produce a list of the changes made to a certain specified number of supplier/vendor master records. To start this program, proceed as follows:

1. Choose from the Accounts Payable menu Periodic processing > Info system > Report selection > Adequacy and documentation > Master data > Changes.
2. Choose Program > Execute.

Dual Control for Changing Master Records

Use

You can use dual control to provide more security when changes are made to sensitive data in your customer and supplier/vendor master records.

Integration

This function can be used for changing customer master records (FI-AR) and supplier/vendor master records (FI-AP).

Prerequisites

You must define the required sensitive fields in the customer or supplier/vendor master record in Customizing (IMG) for Financial Accounting. To do so, choose Financial Accounting > Accounts Receivable and Accounts Payable > Customer Accounts > Master Records > Preparations for Creating Customer Master Records > Define Sensitive Fields for Dual Control.

You must be authorized to change master records. You also define authorizations in Customizing (IMG) for Financial Accounting. To do so, choose Financial Accounting > Financial Accounting Global Settings > Maintain Profiles. The person who makes the changes is never allowed to confirm his or her own changes.

Features

You can define the required master data fields as sensitive in Customizing.

When an authorized accounting clerk changes a sensitive field in the customer or supplier/vendor master record (such as Alternative Payee), the relevant account is blocked for the payment run. The changes take effect immediately.

The account remains blocked until a second authorized person confirms the master data changes. However, it is still possible to make a further change to an account that is already blocked.

The second authorized person is informed of the changes by mail or by other means, and then uses the function Master records > Confirmation of change > Single (or List) to edit the changes.

If the second authorized person **does not** confirm the master data change, the relevant account continues to be blocked for the payment run. The changes are likewise **not** reset.

Confirm or Refuse Master Record Changes

Use

You are using dual control for master data maintenance and wish to confirm changes made to sensitive fields in the master record.

Prerequisites

You are authorized to confirm changes and have not changed the relevant master data fields in question yourself.

Procedure

You can edit changes to master data either individually or in lists. In the customer menu choose Master data > Confirmation of change > List or Master data > Confirmation of change > Single. This procedure describes the List editing function.

If you choose List, the Display/Confirm Critical Customer Changes dialog box appears.

Enter the desired accounts (for changes to general data) as differentiation and if necessary the required company code (for changes to posting data). Check the changes you want to edit and choose continue.

The Display/Confirm Critical Customer Changes dialog box appears with a list of the changed accounts. Stoplights indicate the status of each account:

Green = Change confirmed

Yellow = Change unconfirmed

Red = Change rejected

Select an account from the list to edit it. The Confirm Customer Change screen appears. You then have the option of viewing the changes one more time before either confirming or refusing them.

If you refuse the changes, you can send a workflow note to the relevant clerk explaining why you did so, and suggesting how best to proceed. Choose System > Workflow > Send object with note.

If you have edited an account, save your entries. Choose Back to go back to the displayed list.

Result

When you have edited and saved the changed account, the message “Changes have been made” appears, and the stoplight shows the new status of the account.

Requesting a Master Data Change in the Intranet/Internet (AC)

Purpose

You can request the change to the following master data from the Intranet/Internet:

Object	Type of change
Cost centers	create, change, lock
Internal orders	date
G/L accounts	create, change
Vendors	Address change Enter, delete, change bank details
Customers	Address change Enter, delete, change bank details

You can only request changes to master data for customers and vendors via the Internet.

You do not have to know the name of the processor, since the system automatically determines it. The request is transferred to the SAP System and can be processed there with the functions of the message processing.

You can call up the individual request forms from the various SAP application (depending on the object) and from the workplace.

Start change request	for <Object>
From the Employee Workplace launchpad	Cost centers, internal orders, G/L accounts, customers, vendors
from the Enterprise Organization	Cost centers
From Editing the standard hierarchy	Cost centers
From the cost center master data report	Cost centers
From the web transaction Create internal order	Internal orders
From the web transaction Display internal order	Internal orders

From Editing G/L account master data individually	G/L accounts

Prerequisites

In a scenario, you have defined the process for request a master data change.

To do so, in Customizing choose **Cross-Application Components → Internet/Intranet Services → Internal Service Request → Definition of Scenarios with Specific Customizing → Request For Change to Master Data → Define Own Scenarios For Request For Change To Master Data**

For cost centers and G/L accounts, you have determined which requests can be started from the aforementioned SAP applications.

To do so, in Customizing choose (for example) **Cross-Application Components → Internet/Intranet Services → Internal Service Request → Definition of Scenarios with Specific Customizing → Request For Change to Master Data → Assign Own Scenarios For the Request For Change To Master Data**

Process Flow

You call up the request form for a master data change.

To call up the form from the Employee Workplace launchpad, choose **Create internal service request** .

To call up the form from the SAP System, for the application choose Extras Change request for < **object** >.

In the master data directory, specify that a cost center has to be changed.

From the directory, you can go to the request form for master data changes by choosing **Extras → Change request for cost centers.**

You request a change to or a new master record using the form in the Intranet/Internet (see Processing Request Forms).

When you send the request, the information is transferred to the SAP system. The system determines the responsible processor based on entries made in Customizing (see **Define Own Scenarios For The Request For Change to Master Data**).

The processor receives the request for a master data change in his/her worklist or workflow inbox (see Task Processing).

The following options are available to the processor:

They may require additional information, should the request be incomplete. They attach a note to the requests and enter the person making the request as the processor.

The processor rejects the request for a master data change.

They approve the request and makes the necessary adjustments in the system.

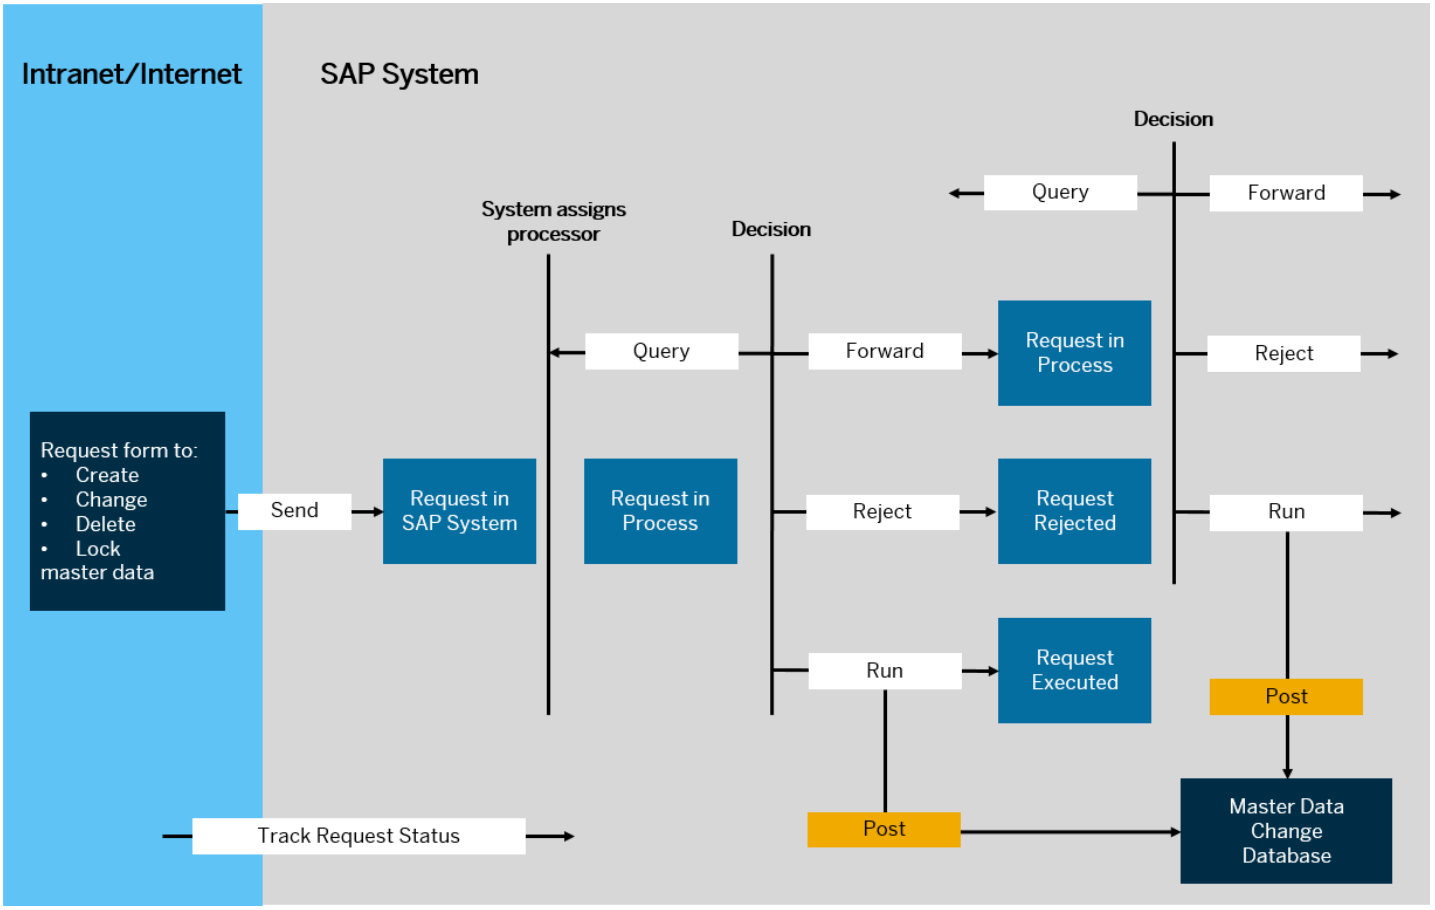

They forward the request.

In the second decision level, the options a to d are available again.

In the last three cases, the processor can enter a text to explain the reason for his/her decision.

You can check the current state of the request at any time (see Status Query of a Request).

Request for Master Data Change

Result

The master data change is either completed or the request is rejected.

For more information, see the **SAP Library** under **Cross-Application Components** → Internal Service Request

Processing Request Forms

Use

With a request form, you can request a master data change from the Intranet/Internet.

The standard system comes with predefined formulas with which you can request changes to various objects. This form is divided into various areas, but you can adjust the layout and the individual fields individually.

Prerequisites

You defined in Customizing which fields are to be available on the form.

For more information, see **Cross-Application Components** → **Internet/Intranet Services** → **Definition of Scenarios With Specific Customizing** → **Request For Master Data Change** → **Define Own Scenarios For The Request For Master Data Change**

You have defined the layout of the form

Using the SAP@Web Studios

Using the Web Application Builder in the **ABAP Development Workbench**

If you access the form via **Create an Internal Service Request** from the launchpad of the Employee Workplace, you first have to select the right request from, such as a request for a new cost center or a change to customer bank details (see Creating an Internal Service Request).

Procedure

Enter the data for the object.

For the request Create a new cost center, your are required to make the following entries:

- Controlling area

- Cost center key

- Valid from ... to

- Name

- Responsible person

For the request Change an existing cost center, your are required to make the following entries:

- Controlling area

- Cost center key

- Valid from ... to

Enter a text to describe the problem.

This is an optional entry.

If you know the name of the processor for this problem, enter it in the **processor** field.

If a **processor** or a **standard role** was entered in Customizing, these fields contain the corresponding entries. The partner role setting in Customizing controls whether an individual employee or a department is entered as the problem processor. You can find additional information about roles in Defining Roles based on Responsibilities .

If an entire department was entered in Customizing as the processor, you cannot overwrite the **Processor** field. The system displays a list of the processors.

The fields for **Created by** contain your data.

If you make the request on behalf of someone else (for example, for a colleague or boss), you can also list the initiator.

The processor of the request can then contact the initiator directly should any questions arise.

Check your entries.

Send the request.

Confirm the message, that your request has been saved.

Result

The request is transferred to the S/4HANA system and assigned to a processor.

Processing a Request in the SAP System

Use

You have made one of the following requests using an Intranet/Internal request form:

Request Change to Master Data

Request an Adjustment Posting

The request is automatically transferred to the SAP System and assigned to a processor.

Integration

The system creates a message when the request form is sent. The following functions are available for processing messages in the SAP System.

Task processing

The following jumps to the following activities are available in task processing:

- Access to the request form
- Access to the processing transactions in the SAP system

  that were set up in Customizing for the related requests.

See **Cross-Application Components** > **Internet/Intranet Services** > **Internal Service Request** > **Definition of Scenarios with Specific Customizing** > **Request for a Master Data Change (Request for an Adjustment Posting)** > **Define Own Scenarios For The Request For Master Data Change** (Define Own Scenarios For The Request For Adjustment Postings).

Status query

Document Flow Display

The document flow display is **only** relevant for the **request for an adjustment posting** .

Activities

To call up the functions for message processing, in the SAP Easy Access Menu **choose Office** > **Message** .

Note

You can find additional information about messages in the SAP Library under Cross-Application Components (CA-NO) Messages.

Processing Notifications

You have the following options for processing the internal service request:

- Processing notifications
- Processing notifications using the worklist

You call up processing via:

- Office Notification Worklist Notifications or
- Office Notification Change

Process Notification

Use

Put notification in process

Once you have created a notification and entered all relevant information, you can put the notification in process. When you put a notification in process, you release the notification for processing.

A notification can be put in process in the following ways:

- You can put a notification in process manually.
- The system puts a notification in process automatically if an order was created for the notification.

When a notification is put in process, the system changes the status of the notification from "outstanding" (OSNO) to "notification in process" (NOPR).

Postpone notification

In some cases, it may be necessary to delay the processing of a notification (for example, if the assigned tasks cannot be carried out yet).

Using this function, you can postpone the processing of a notification. When you postpone a notification, it receives the status NOPO (notification postponed).

Note

You cannot postpone a notification that has already been put in process.

Complete notification

You complete a notification when the problem has been solved and no further processing is necessary. Once you complete a notification, you can no longer change any data in the notification. You can then only display the notification.

When a notification is completed, it receives the status **NOCO** (**notification completed**).

ⓘ Note

You cannot complete a notification if outstanding tasks still exist in the notification.

Categorizing a notification problem

When you complete a notification, the system displays a dialog box with the current date and time. You can accept the displayed date and time as the completion time or you can change it. In this dialog box, you must specify whether the problem arose because of an internal or external cause. For example, if a vendor delivers a defective product, your are dealing with an externally caused problem.

Put notification in process again

You can put a completed notification in process again, if you determine that additional processing is necessary.

Archive completed notification

Completed notifications are automatically archived and are deleted from the database after a specific, predefined time interval. This time interval is defined in Customizing. Therefore, make sure you have finished processing the notification before you complete it.

Delete notification

In some cases, you may want to delete a notification. You cannot, however, delete a notification directly. You must set a deletion flag in the notification which identifies it as one that can be deleted.

A company typically runs an archiving program at regular intervals. This program searches for the notifications with deletion flags, converts the deletion flags to deletion indicators, and copies the notifications to an archive. The system then deletes the notifications from the database.

ⓘ Note

Before you delete a notification, make sure that it is no longer needed.

Once you set a deletion flag for a notification, you can no longer change the data in the notification. It then receives the status **Deletion flag** and **Completed** . You can now only display the notification. For more information about notification statuses, see Status Management .

If you set a deletion flag in the notification header, the system also sets deletion flags for the individual notification tasks.

You can cancel the deletion flag as long as it has not been converted to a deletion indicator. You can then put the notification back in process and change or display it in the usual manner.

Procedure

Desired processing type	What you should know

Put notification in process	Call up the notification in the create or change mode and then choose Notification > Functions > Put in process.
Postpone notification	Call up the notification in the change mode, choose Notification > Functions > Postpone, and then save the notification.
Complete notification	Call up a notification in the change mode and choose Notification > Functions > Complete. Specify the completion date/time and the cause of the problem; then close the dialog box and save the notification.
Delete notification	To set a deletion flag, call up the notification in change mode and then choose Notification > Functions > Deletion flag > Set > . To reset the deletion flag, choose Notification > Functions > Deletion flag > Deselect > .

Processing Notifications Using Worklist

Use

Using the worklist for notifications, you can select notifications on the basis of different criteria and process them. You can select the notifications as follows:

- You select the notifications using the **My worklist** function. The system then displays the following notifications for further selection and processing:
- All notifications to be processed by you as the "person responsible" or that fall within your department's area of responsibility
- All notifications to be processed by you as a < **Partner function** >
- All notifications you created
- All notifications that were last processed by you
- You select the notifications using the **General selection** function. The system then displays all notifications for further selection and processing. Make sure the preset selection criteria contain the values you want (for example, notification status, selection period).

Prerequisites

If you use the **General selection** function and you want to process notifications for which you are not responsible or which you did not create, you must have the corresponding authorization.

Activities

You choose **Logistics > Central Functions > Notification > Worklist > Notifications** to call up the worklist for notifications.

You enter the required data and choose **Execute** .

See also:

Select and Process Notifications Using Worklist

Task Processing

Purpose

You can use the task processing functions to process or display tasks belonging to a message separately from the higher level messages. This lets you:

- Process tasks quickly and easily
- Execute task processing using the functions in the action box
- Access information about higher level messages at any time

Process Flow

1. Regardless your role or your workflow, you can use the following options to process tasks:

- Worklist

Call up the worklist for the task to see whether you have any tasks you need to process.

- Workflow

Check your workflow inbox to see whether you have any tasks that you need to process.

- Task Processing Functions

If you want to process a specific task belonging to a message, use the transactions for processing or displaying a task.

1. After selecting or executing one of the functions, you process a task in one of these ways:

- Forward the task to another person if you **cannot** process it
- Execute instructions that are not linked to the task
- Document the contents of a task you've just executed, for example, using a long text for the task, or an activity in the action box (internal comment)
- Set the task to "completed" after you have executed the instructions
- Execute potential additional activities using the action box if further tasks are necessary

Result

After you have processed and completed the task, the message can be closed (if there are **no** more tasks that need to be processed in the message).

Processing Tasks Using Worklist

Use

Using the worklist for tasks, you can select notification tasks based on of different criteria and process them. You can select the tasks as follows:

- You select the tasks using the **My worklist** function. The system then displays the following tasks for further selection and processing:
- All outstanding tasks to be processed by you as the person responsible
- All tasks to be processed by you as a **function**
- All tasks you created
- All tasks you completed
- You select the tasks using the **General selection** function. The system then displays all tasks for further selection and processing. Note the preset selection criteria (for example, selection period, outstanding tasks only).

Prerequisites

If you use the **General selection** function and you want to process tasks for which you are **not** responsible or which you did **not** create, you must have the corresponding authorization.

Activities

Choose **Logistics** > **Central functions** > **Notification** > **Worklist** > **Tasks** to call up the worklist for tasks.

Enter the required data and choose **Execute**.

See also:

Select and Process Tasks Using the Worklist

Processing Tasks Using Workflow

Use

If a task is created in a notification or if the person responsible for a task changes, the system can automatically notify the person or department responsible via the **SAP Business Workflow** that a task needs to be processed.

You receive the information about the task that needs to be processed as a **work item** in your inbox (**Business Workplace**). Your inbox provides an overview of all tasks that you are responsible for processing. You can begin processing the work item directly from your business workplace.

Integration

You can access the Business Workplace by choosing **Office** > **Workplace** Then choose **Inbox** > **Workflow** to display an work items that may be present.

Prerequisites

You have made the system settings needed to activate the **SAP Business Workflow**.

Activities

If there is a work item in your inbox, proceed as follows to begin processing it:

- You double click the work item to display a description of the task to be executed.
- Choose **Execute** to process the work item. The system calls up the transaction to process the task.

Status Query For Request

Use

You can call up the status of the request at any time during its runtime.

Status Management For Notifications

Display Status Information

System Status Assignment

Assigning And Changing User Statuses

Status Management For Tasks

Blocking a Supplier/Vendor Account

Within **Accounts Payable**, you can block a supplier/vendor account for posting. You have to block a supplier/vendor master record before you can mark it for deletion. You would also block a supplier/vendor that you use only as an alternative payment recipient, so that nobody can post to it by mistake.

There are several fields in the supplier/vendor master record available to you. You can set the following blocks:

- Posting block for certain company codes or for all company codes
- Purchasing block for certain purchasing organizations or for all purchasing organizations. This is of course only if you have purchased and installed the purchasing application component.

This topic describes how to block a supplier/vendor account and blocking an account for the accounting department only. A separate topic explains how you block a supplier/vendor from being paid.

You can cancel a supplier/vendor account block at any time. To do this, simply remove the relevant indicator.

⚠ Caution

Only block an account if there are no more open items in the account. If an account is blocked, you cannot clear any open items in it.

See also:

Blocking a Supplier/Vendor Account Centrally

Blocking a Supplier/Vendor Account for Posting

Blocking a Supplier/Vendor Account Centrally

When you block an account centrally, you can prevent both posting and order processing, if you have purchased, installed, and configured the **Materials Management** (MM) application component.

Block a supplier/vendor account centrally as follows:

1. Choose **Master records** > **Maintain centrally** > **Block/unblock**.
2. The system displays the initial screen. On this screen, you can specify the areas that you need to block by entering the company code and purchasing organization. If you do not specify the key for an area, the corresponding block fields are not set.
3. Enter the supplier/vendor's account number and the company code. Optionally enter the purchasing organization.
4. Select ENTER.
5. The **Block/Unblock Vendor: Details** screen is displayed.
6. To block posting, select the company code of the displayed supplier/vendor master record or select all company codes by clicking in the corresponding field.
7. To block purchasing, select either the displayed purchasing area or all purchasing organizations by clicking next to the corresponding field.
8. Save your entries by choosing **Vendor** > **Save**.

The system displays the initial screen and a message that confirms that the data has been saved.

Blocking a Supplier/Vendor Account for Posting

When you block a supplier/vendor master record for posting, you prevent the system from posting to this account.

Block a supplier/vendor account from posting as follows:

1. Choose **Master records** > **Block/unblock**.
2. The system displays the initial screen.
3. Enter the supplier/vendor's account number and, if required, the company code.
4. If you do not enter a company code, you can only block posting for this supplier/vendor in all company codes.
5. Select ENTER.
6. The system displays the entry screen for the block indicators.
7. Select for blocking either all company codes or the specified company code by clicking the appropriate field.
8. Save your entries by choosing **Vendor** > **Save**.

The system displays the initial screen and a message that confirms that the data has been saved.

Blocking a Supplier/Vendor Account for Payments

To block a supplier/vendor master record for the payment program or for manual payments, you have to change the supplier/vendor master record. When you block the supplier/vendor account for the payment program, the payment program still processes the open items in the account during the payment run, but it does not pay any open items from the blocked accounts. You can display a list of suppliers/vendors blocked from the payment program.

To block a supplier/vendor for the payment program, enter a block key in the supplier/vendor master record. These keys represent reasons for blocking. You use them to show why an account was blocked.

Block the account for the payment program as follows:

1. Choose Master records > Change.
2. The system displays the initial screen for changing a supplier/vendor master record.
3. Enter the supplier/vendor account number and the company code.
4. Select the payment transaction data screen in the company code data area by clicking in the appropriate field and then selecting ENTER.
5. To block this supplier/vendor for the payment program (or manual payments), enter the appropriate blocking key in the Payment block field.
6. Choose Vendor > Save to save the vendor master record.

The system displays the initial screen and a message that confirms that the data has been saved.

Archiving and Deleting a Supplier/Vendor Master Record

You can archive supplier/vendor master records that you no longer need. When data is archived, it is extracted from the SAP database, deleted, and placed in a file. You can then transfer this file to an archive system. For more information on archiving supplier/vendor master data, see the Application Data Archiving and Reorganization documentation.

Supplier/Vendor master records cannot be archived immediately. The system first has to check whether the following requirements have been met:

- The account must not contain any transaction figures or documents in the system.
- The account must be marked for deletion in its master record.

> **Note**
> You should block an account for posting before you mark it for deletion. The only effect this deletion flag has is to cause a warning to be issued every time you subsequently try to post to this account. You can delete the test data before going live with your system. For more information, see the Delete Vendor Master Data activity in the Implementation Guide (IMG) for Accounts Receivable and Accounts Payable.

The following section explains how to mark master records and their supplier/vendor accounts for deletion. The deletion process for supplien/vendor master records is described in the FI - Closing and Reporting documentation.

The organization of master data in your system is also an important part of marking master records for deletion. You can set the deletion flag at the level of the general data area, or at the level of one specific company code.

You can cancel a deletion flag at any time as long as the master record has not yet been physically deleted from the system.

> **Note**

If all open items in the supplier/vendor account you are deleting have been cleared, you should block it for posting so that other users cannot post to it. For more information on this, see Blocking a Supplier/Vendor Account for Posting.

See also:

Marking a Master Record for Deletion Centrally

Marking a Master Record for Deletion for Accounting

Marking a Master Record for Deletion Centrally

Mark a supplier/vendor for deletion centrally as follows:

1. Choose **Master records** > **Maintain centrally** > **Mark for deletion**.
2. The initial screen appears.
3. Enter the supplier/vendor account number and, if you wish, the company code and a purchasing organization.
4. If you do not specify the key for a purchasing organization, you cannot delete this area at a later date, should you wish to.
5. Select ENTER.
6. The screen for specifying data for deletion appears.
7. Select data to mark for deletion by clicking **next** to the appropriate field.
8. Save your entries by choosing **Vendor** > **Save**.

The system displays the initial screen, with a message confirming that the data has been saved.

Marking a Master Record for Deletion for Accounting

Mark a supplier/vendor master record for deletion for the Accounting Department as follows:

1. Choose **Master records** > **Mark for deletion**.
2. The system displays the initial screen.
3. Enter the supplier/vendor's account number and the company code.
4. Select ENTER.
5. The system displays the screen for selecting areas to mark for deletion.
6. Select the data either in the company code or in all areas to mark for deletion.
7. If you click next to the **All areas** field, the system will later delete all data for all company codes and for all purchasing areas in this supplier/vendor master record.
8. Save your entries by choosing **Vendor** > **Save**.

ℹ Note

After you mark a supplier/vendor master record for deletion, you can still post to the supplier/vendor account. This is necessary, since you might still need to clear open items. When you post, the system issues a warning that you are posting to

an account that is marked for deletion.

Automatic Transfer of Supplier/Vendor Master Data

You can transfer supplier/vendor master data automatically using batch input. The system carries out the function of creating a supplier/vendor master record for each master record. By doing this, the data is transferred to the screen fields and checked.

You should first maintain in the system all the appropriate keys and indicators, and any other master records which are referred to. If you do not do so, errors may occur when you transfer data.

ℹ Note

You should check in any case whether the field status definitions are correct. Errors occur if you suppress fields via the field status definition and then provide field contents when you transfer data.

For more information, see the **Data Transfer** section in the document **General FI Topics**.
